# **Algorithmic Foundations**

**Divide and Conquer**

**Prudence Wong**

**<http://www.csc.liv.ac.uk/~pwong/teaching/comp108/201617>**

# Pancake Sorting

**Input:** Stack of pancakes, each of **different** sizes

**Output:** Arrange in **order of size** (smallest on top)

**Action:** Slip a **flipper** under one of the pancakes and **flip** over the **whole stack** above the flipper

# Triomino Puzzle

**Input:**  $2^n$ -by- $2^n$  chessboard with **one** missing square & many **L-shaped** tiles of **3** adjacent squares

**Question:** **Cover** the chessboard with L-shaped tiles without overlapping

Is it do-able?

# Divide and Conquer ...

# Learning outcomes

- Understand how divide and conquer works and able to analyse complexity of divide and conquer methods by solving recurrence
- See examples of divide and conquer methods

# Divide and Conquer

One of the **best-known** algorithm design techniques

Idea:

- A problem instance is divided into several **smaller** instances of the same problem, ideally of about same size
- The smaller instances are **solved**, typically **recursively**
- The solutions for the smaller instances are combined to get a solution to the large instance

# Merge Sort ...

# Merge sort

- using divide and conquer technique
- divide the sequence of  $n$  numbers into two halves
- **recursively** sort the two halves
- **merge** the two sorted halves into a single sorted sequence

51, 13, 10, 64, 34, 5, 32, 21

we want to sort these 8 numbers,  
**divide** them into two halves

51, 13, 10, 64, 34, 5, 32, 21

51, 13, 10, 64

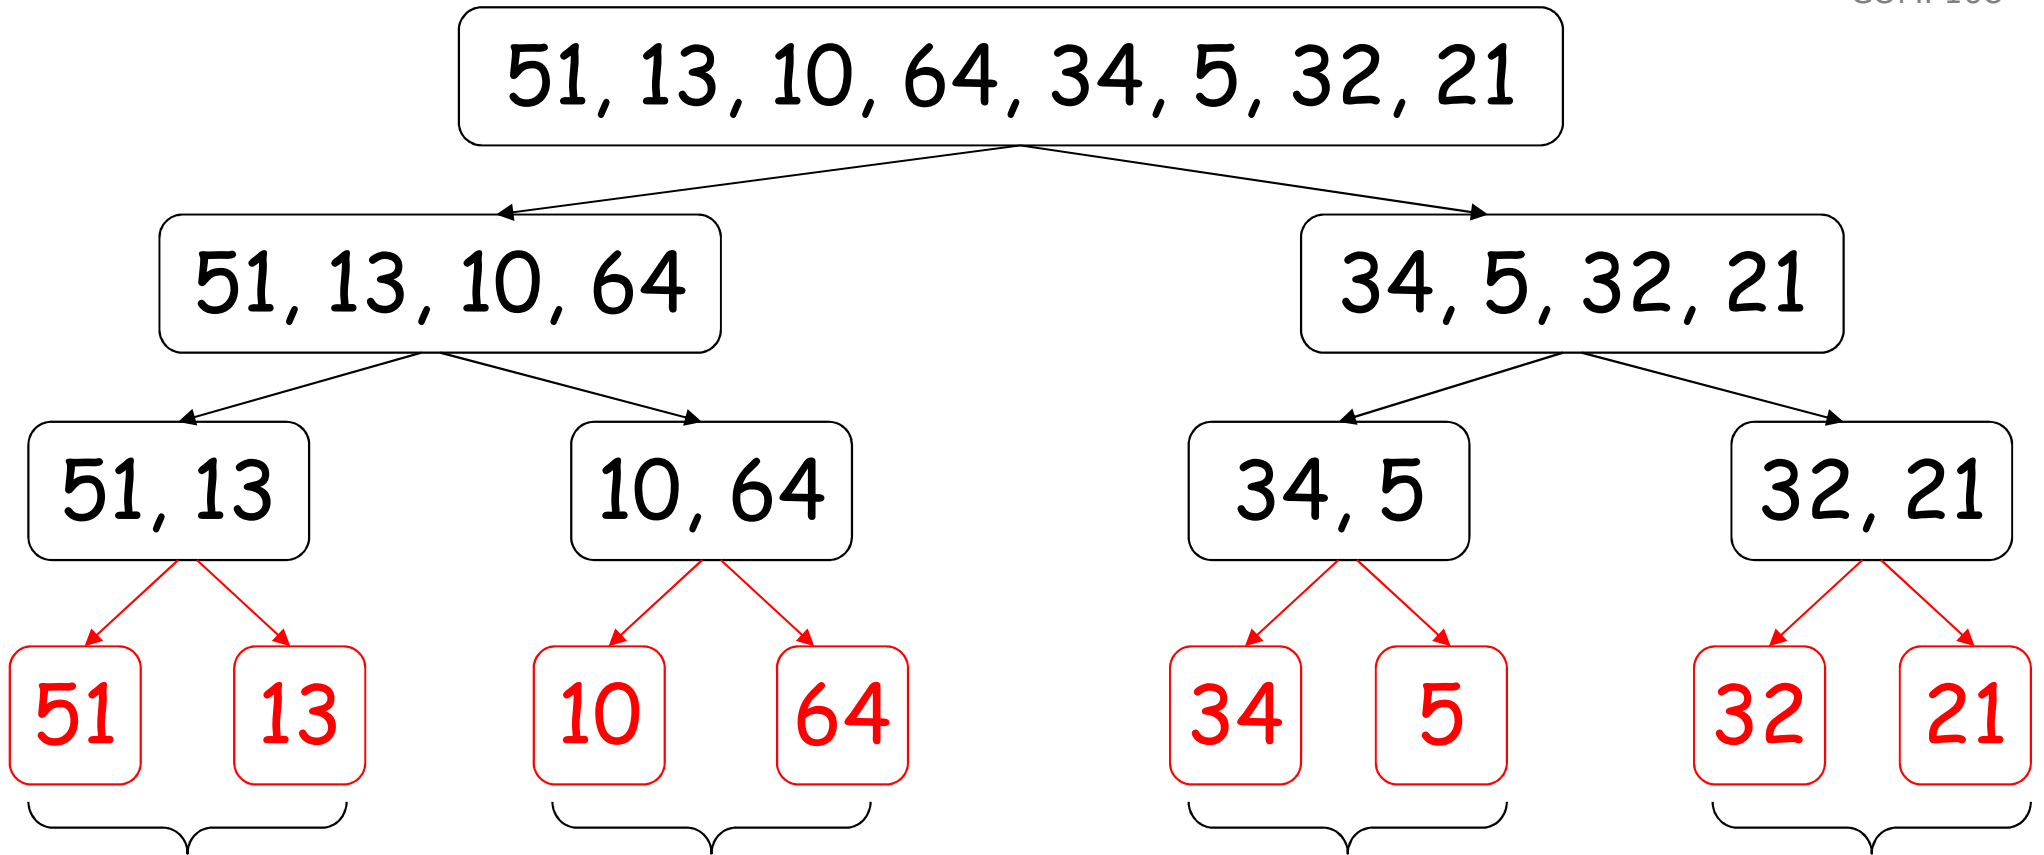

34, 5, 32, 21

**divide** these 4  
numbers into  
halves

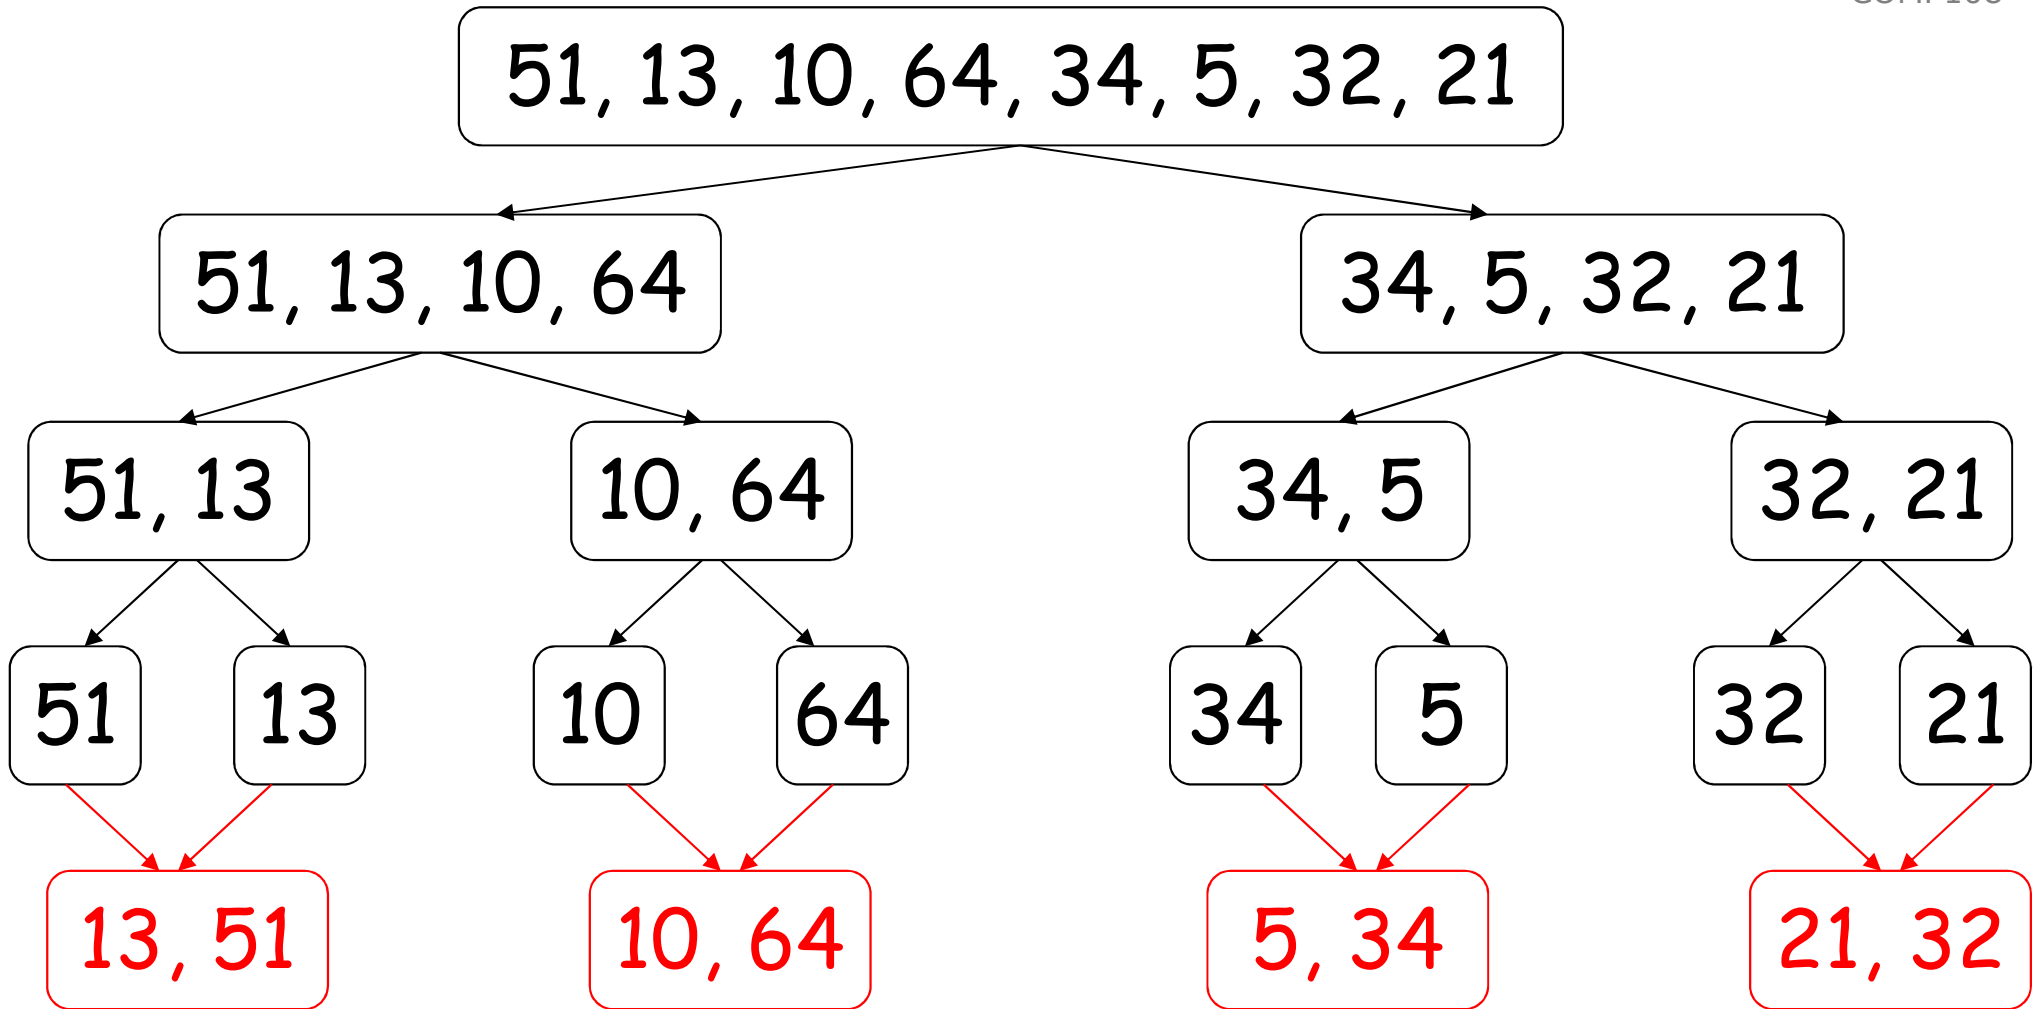

similarly for  
these 4

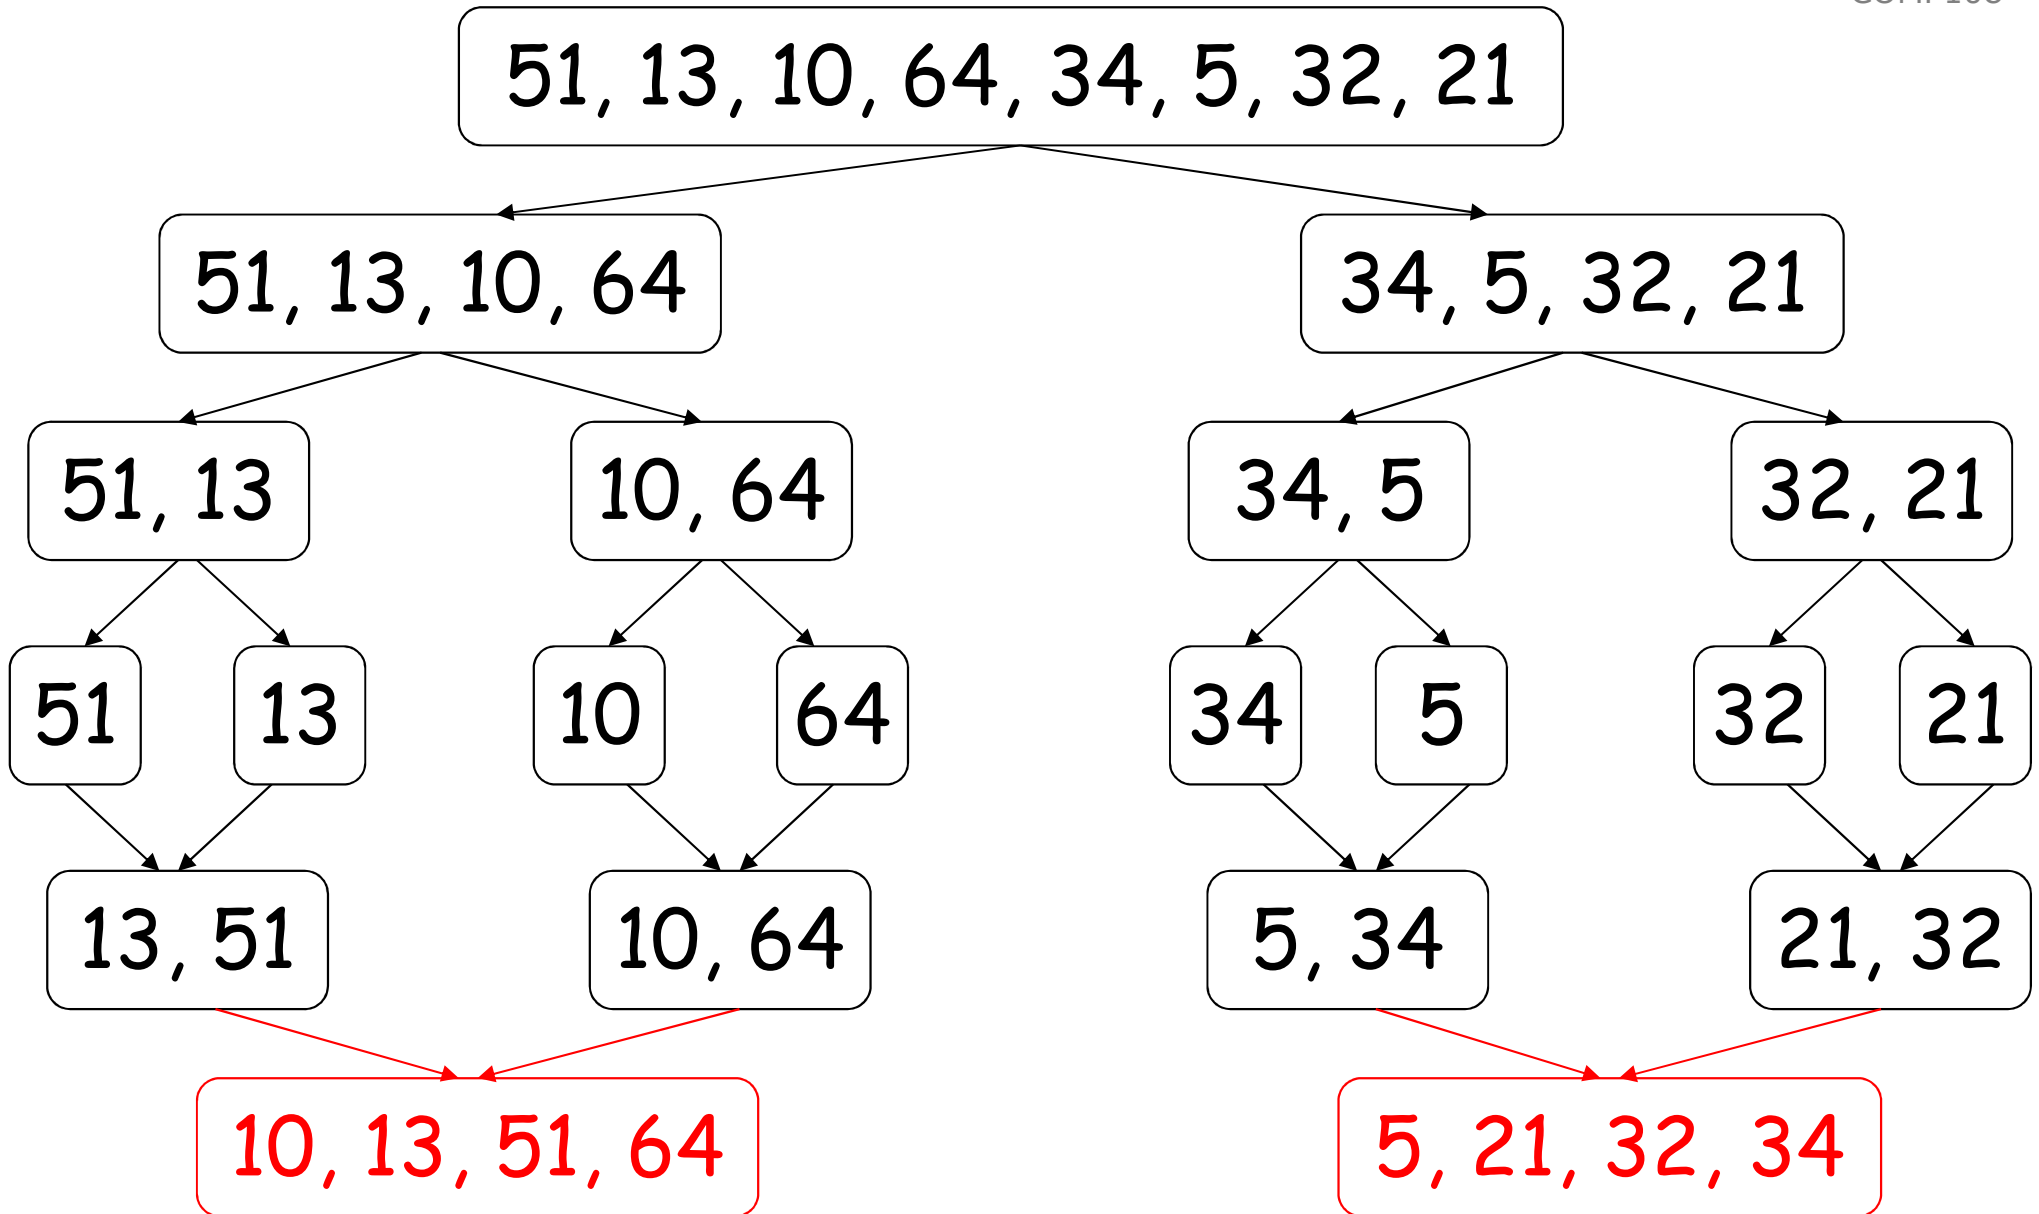

further divide each shorter sequence ...  
until we get sequence with only **1** number

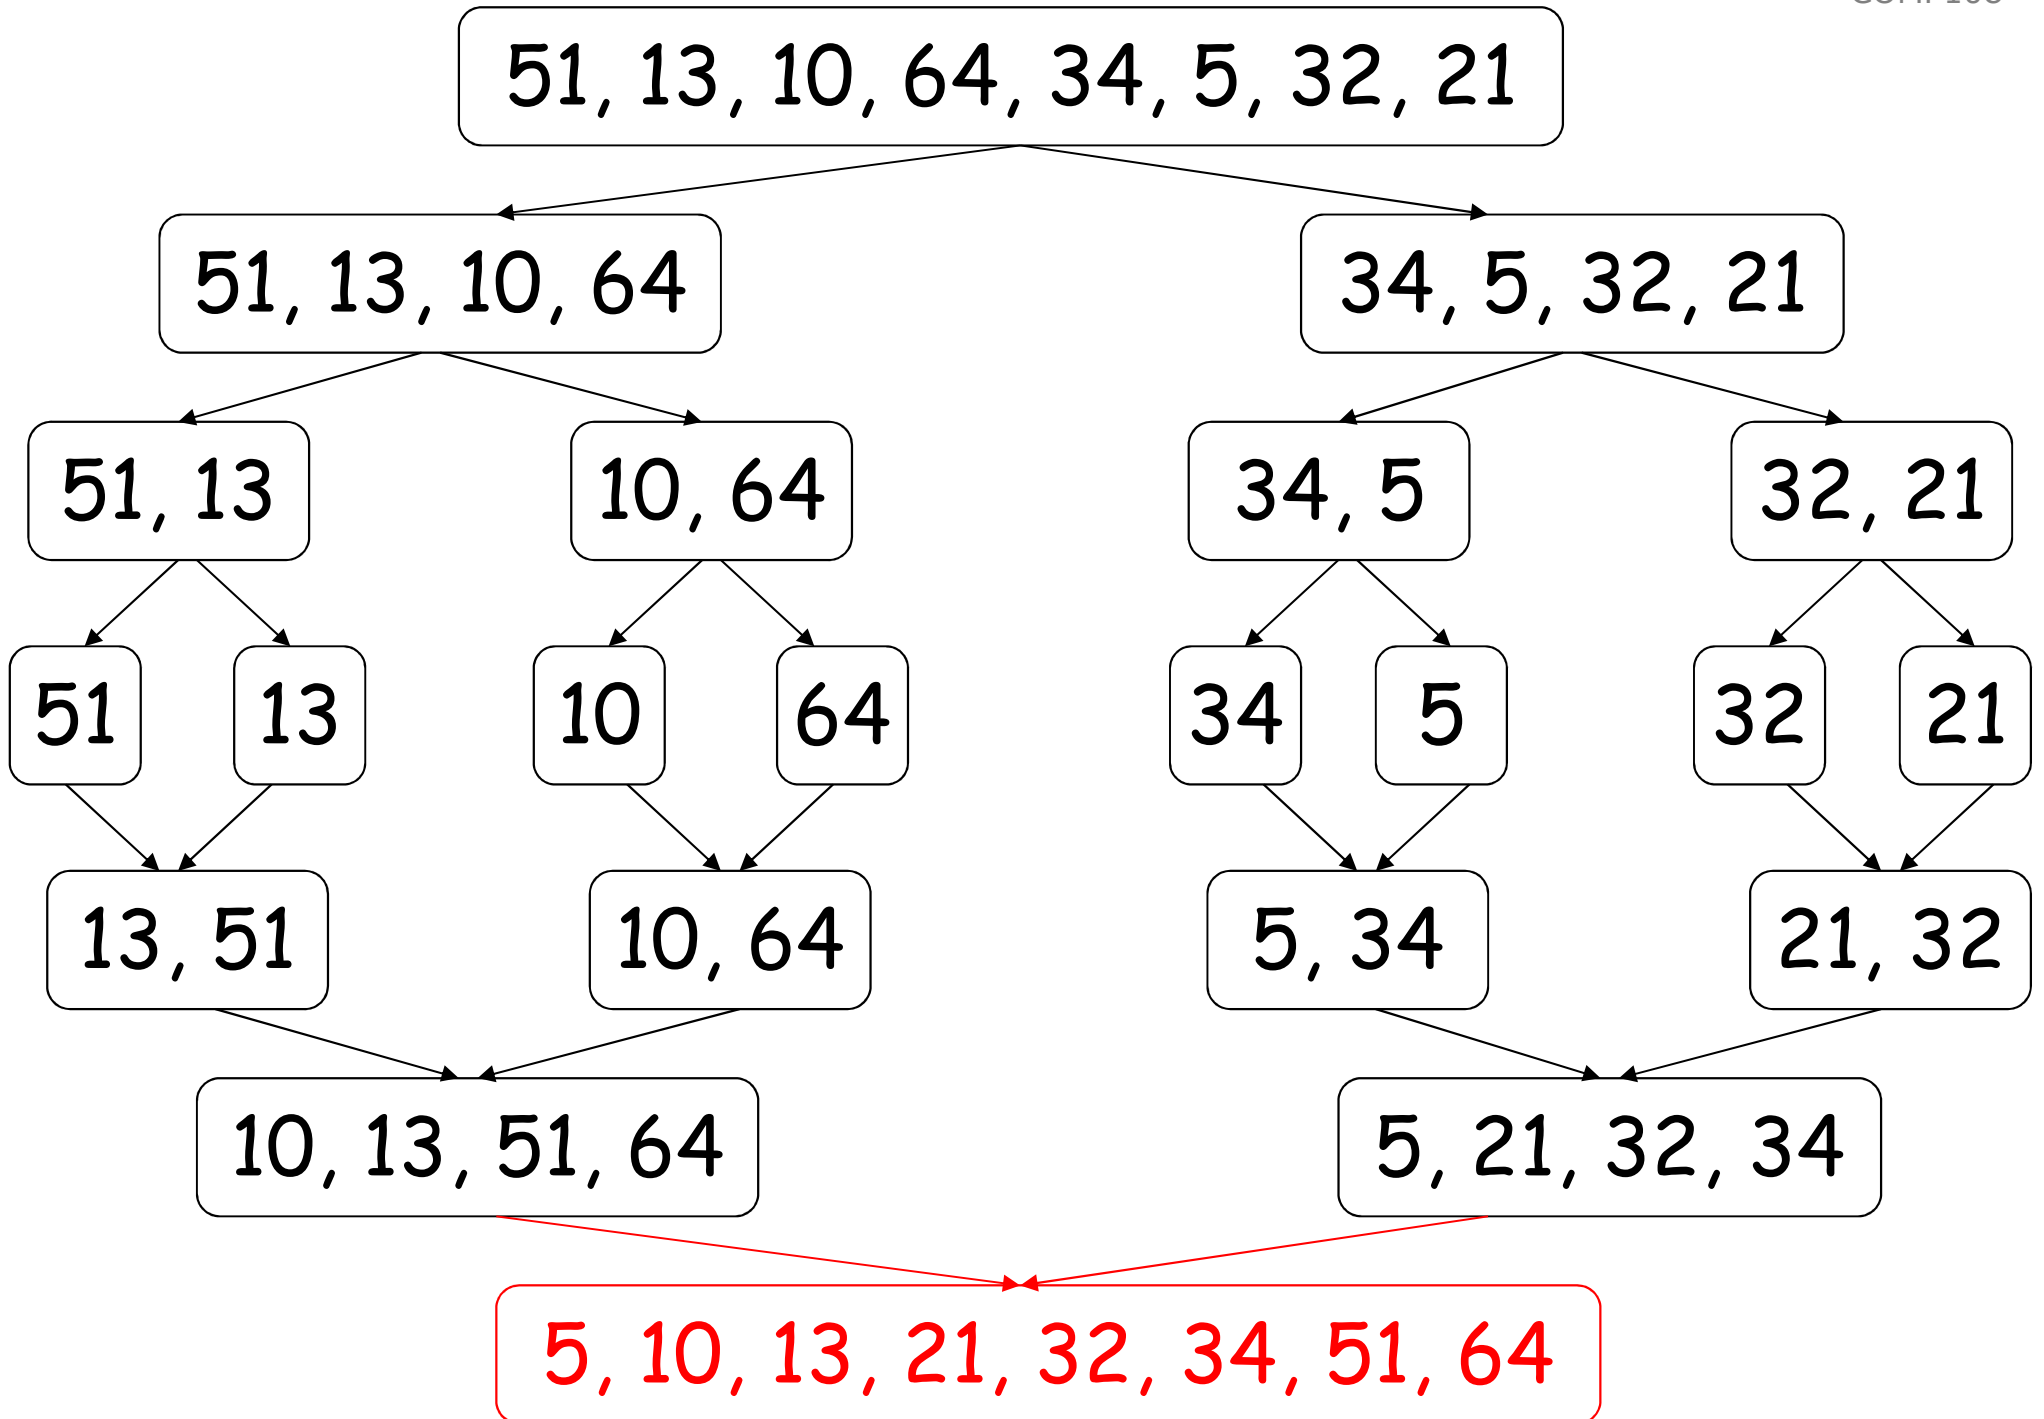

**merge** pairs of  
single number into  
a sequence of 2  
sorted numbers

then **merge** again into sequences of 4 sorted numbers

one more merge give the **final sorted sequence**

# Summary

## Divide

- dividing a sequence of  $n$  numbers into **two** smaller sequences is straightforward

## Conquer

- merging two sorted sequences of **total length  $n$**  can also be done easily, at most  **$n-1$**  comparisons

10, 13, 51, 64

5, 21, 32, 34

Result:

To merge two sorted sequences,  
we keep two **pointers**, one to each sequence

Compare the two numbers pointed,  
copy the **smaller** one to the result  
and **advance** the corresponding pointer

10, 13, 51, 64

5, 21, 32, 34

Result: 5,

Then compare again the two numbers  
pointed to by the pointer;  
copy the smaller one to the result  
and advance that pointer

10, 13, 51, 64

5, 21, 32, 34

Result:

5, 10,

Repeat the same process ...

10, 13, 51, 64

5, 21, 32, 34

Result: 5, 10, **13**

Again ...

10, 13, 51, 64

5, 21, 32, 34

Result: 5, 10, 13, **21**

and again ...

10, 13, 51, 64

5, 21, 32, 34

Result: 5, 10, 13, 21, **32**

...

10, 13, 51, 64

5, 21, 32, 34

Result: 5, 10, 13, 21, 32, 34

When we reach the **end** of one sequence,  
simply copy the **remaining** numbers in the other  
sequence to the result

10, 13, 51, 64

5, 21, 32, 34

Result: 5, 10, 13, 21, 32, 34, **51, 64**

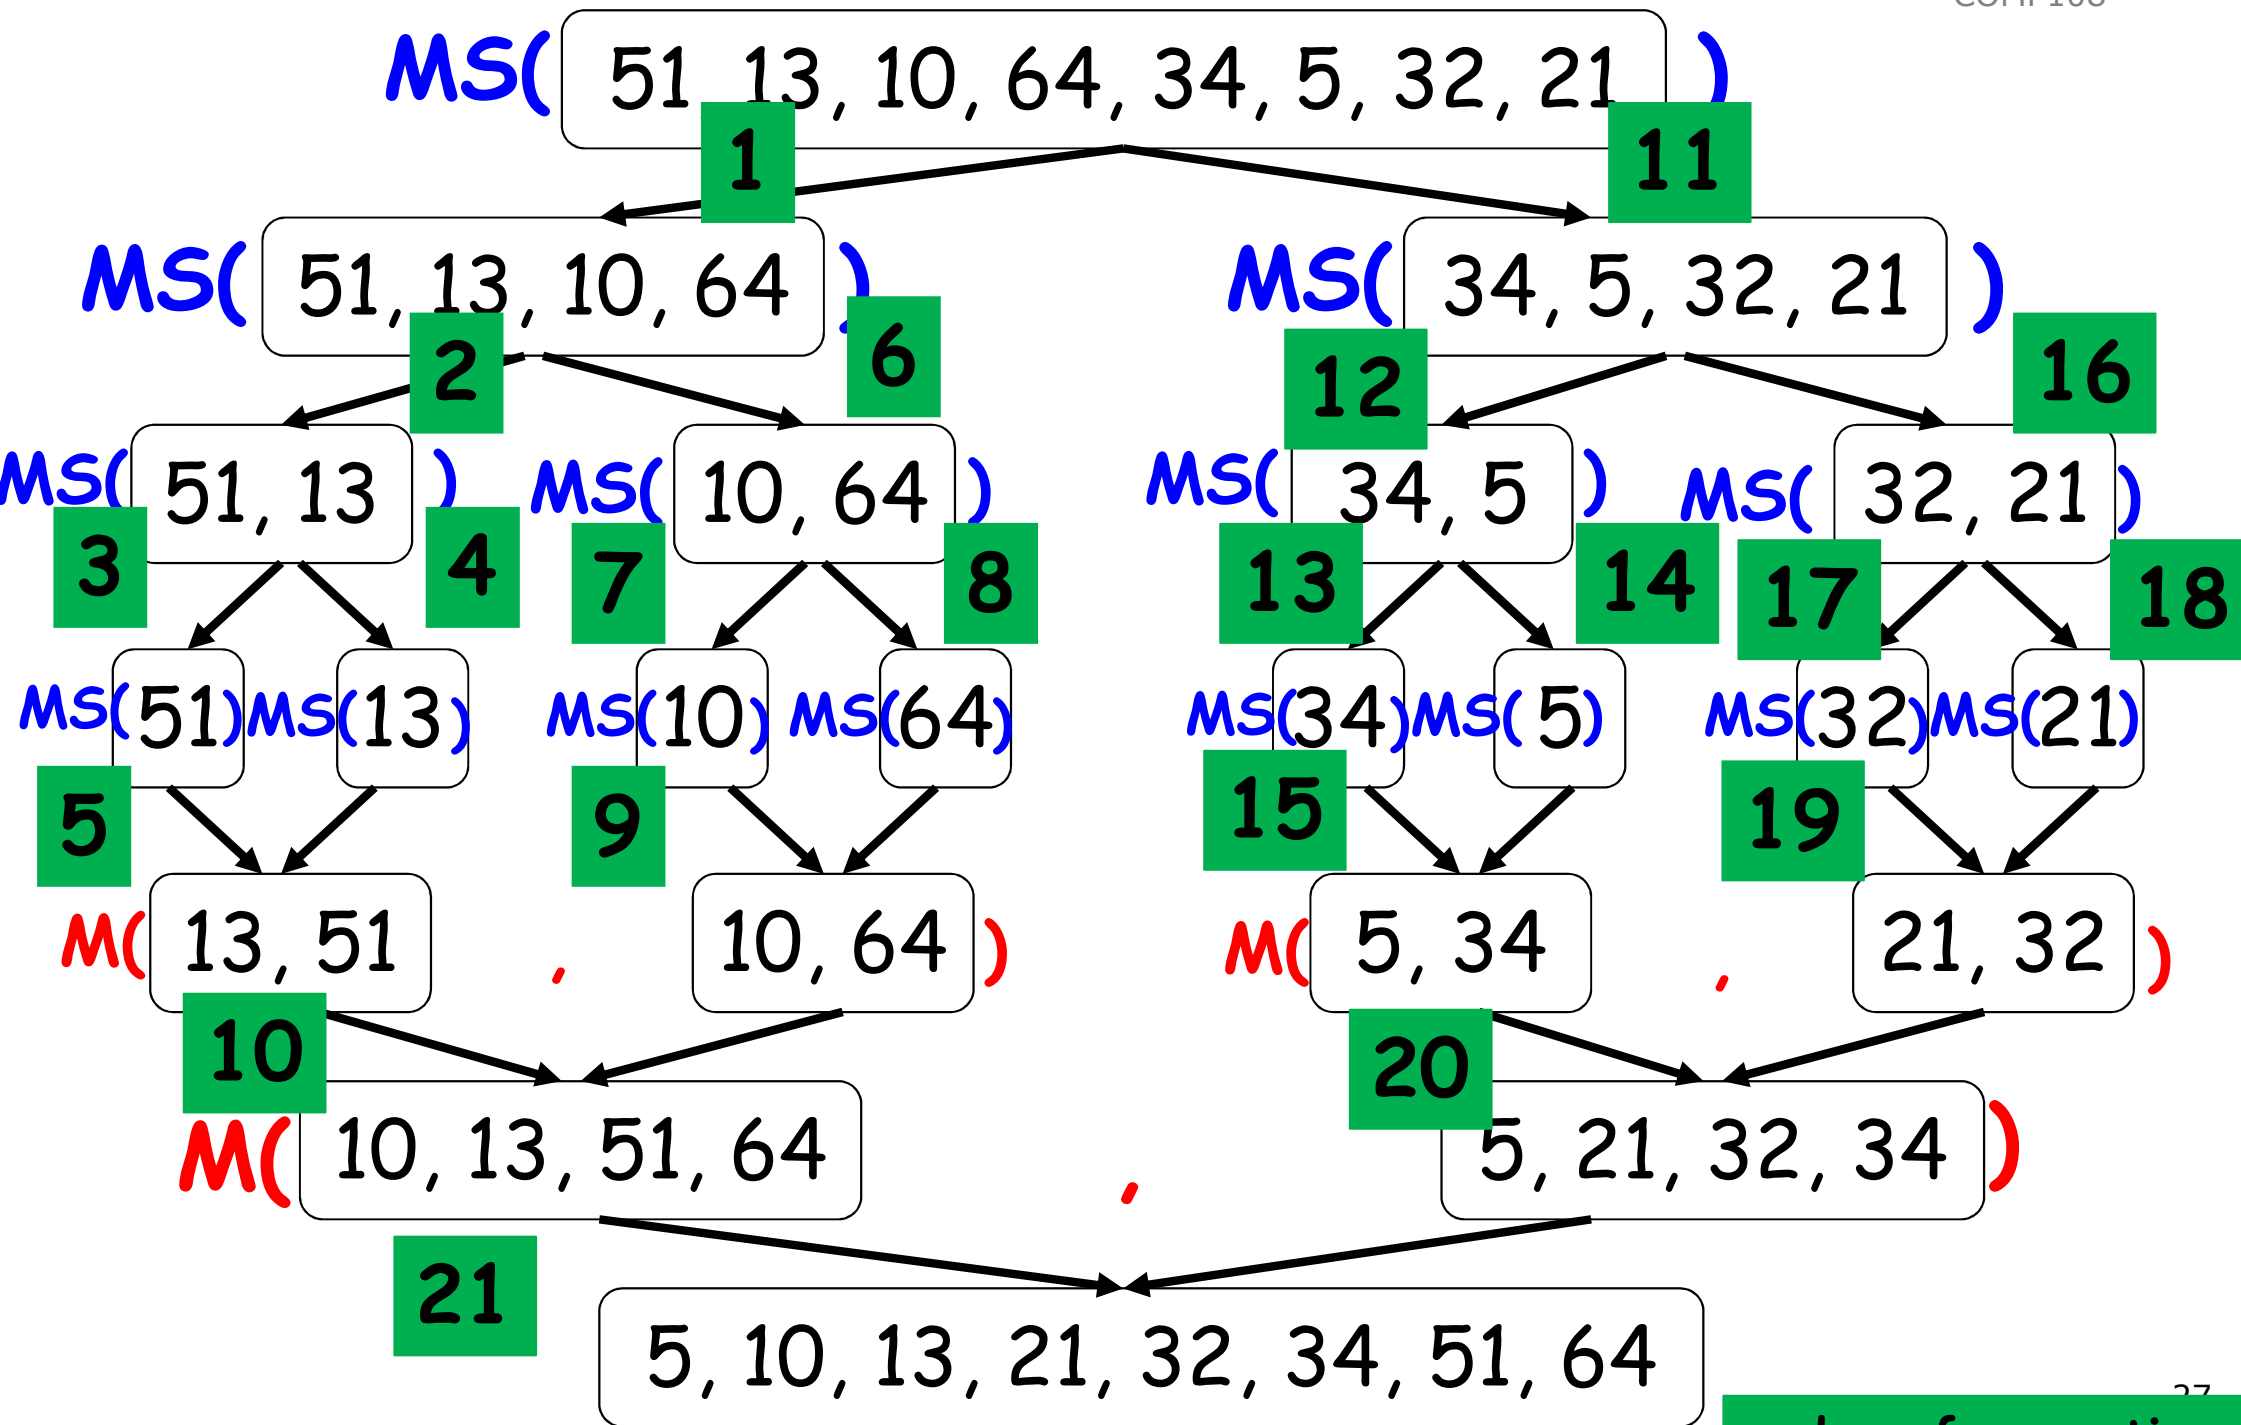

Then we obtain the final sorted sequence

# Pseudo code

```
Algorithm Mergesort(A[1..n])
  if n > 1 then begin
    copy A[1..⌊n/2⌋] to B[1..⌊n/2⌋]
    copy A[⌊n/2⌋+1..n] to C[1..⌈n/2⌉]
    Mergesort(B[1..⌊n/2⌋])
    Mergesort(C[1..⌈n/2⌉])
    Merge(B, C, A)
  end
```

# Pseudo code

```
Algorithm Merge (B[1..p], C[1..q], A[1..p+q])
  set i=1, j=1, k=1
  while i<=p and j<=q do
  begin
    if B[i]≤C[j] then
      set A[k] = B[i] and i = i+1
    else set A[k] = C[j] and j = j+1
    k = k+1
  end
  if i==p+1 then copy C[j..q] to A[k..(p+q)]
  else copy B[i..p] to A[k..(p+q)]
```

$p=4$

$q=4$

**B:**

10, 13, 51, 64

**C:**

5, 21, 32, 34

|                      | i | j | k | A[ ]                          |
|----------------------|---|---|---|-------------------------------|
| Before loop          | 1 | 1 | 1 | empty                         |
| End of 1st iteration | 1 | 2 | 2 | 5                             |
| End of 2nd iteration | 2 | 2 | 3 | 5, 10                         |
| End of 3rd           | 3 | 2 | 4 | 5, 10, 13                     |
| End of 4th           | 3 | 3 | 5 | 5, 10, 13, 21                 |
| End of 5th           | 3 | 4 | 6 | 5, 10, 13, 21, 32             |

|                      |   |   |   | 5, 10, 13, 21, 32, 34, 51, 64 |

# Time complexity

Let  $T(n)$  denote the time complexity of running merge sort on  $n$  numbers.

$$T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T\left(\frac{n}{2}\right) + n & \text{otherwise} \end{cases}$$

We call this formula a recurrence.

A recurrence is an equation or inequality that describes a function in terms of its value on smaller inputs.

To solve a recurrence is to derive *asymptotic bounds* on the solution

# Time complexity

Prove that  $T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T(\frac{n}{2}) + n & \text{otherwise} \end{cases}$  is  $O(n \log n)$

**Make a guess:**  $T(n) \leq 2 n \log n$  (We prove by MI)

For the base case when  $n=2$ ,  
L.H.S =  $T(2) = 2 \times T(1) + 2 = 4$ ,  
R.H.S =  $2 \times 2 \log 2 = 4$   
L.H.S  $\leq$  R.H.S

## Substitution method

# Time complexity

Prove that  $T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T(\frac{n}{2}) + n & \text{otherwise} \end{cases}$  is  $O(n \log n)$

**Make a guess:**  $T(n) \leq 2 n \log n$  (We prove by MI)

Assume true for all  $n' < n$  [assume  $T(\frac{n}{2}) \leq 2 \times (\frac{n}{2}) \times \log(\frac{n}{2})$ ]

$$T(n) = 2 \times T(\frac{n}{2}) + n$$

by hypothesis

$$\leq 2 \times (2 \times (\frac{n}{2}) \times \log(\frac{n}{2})) + n$$

$$= 2 n (\log n - 1) + n$$

$$= 2 n \log n - 2n + n$$

$$\text{i.e., } T(n) \leq 2 n \log n$$

$$\leq 2 n \log n$$

# Example

$$T(n) = \begin{cases} 1 & \text{if } n=1 \\ T\left(\frac{n}{2}\right) + 1 & \text{otherwise} \end{cases}$$

Guess:  $T(n) \leq 2 \log n$

For the base case when  $n=2$ ,

$$\text{L.H.S} = T(2) = T(1) + 1 = 2$$

$$\text{R.H.S} = 2 \log 2 = 2$$

$$\text{L.H.S} \leq \text{R.H.S}$$

# Example

$$T(n) = \begin{cases} 1 & \text{if } n=1 \\ T\left(\frac{n}{2}\right) + 1 & \text{otherwise} \end{cases}$$

**Guess:**  $T(n) \leq 2 \log n$

Assume true for all  $n' < n$  [assume  $T\left(\frac{n}{2}\right) \leq 2 \times \log\left(\frac{n}{2}\right)$ ]

$$T(n) = T\left(\frac{n}{2}\right) + 1$$

$$\leq \underbrace{2 \times \log\left(\frac{n}{2}\right)} + 1 \quad \leftarrow \text{by hypothesis}$$

$$= 2 \times (\log n - 1) + 1 \quad \leftarrow \log\left(\frac{n}{2}\right) = \log n - \log 2$$

$$< 2 \log n$$

**i.e.,  $T(n) \leq 2 \log n$**

# More example

Prove that  $T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T(\frac{n}{2}) + 1 & \text{otherwise} \end{cases}$  is  $O(n)$

**Guess:**  $T(n) \leq 2n - 1$

For the base case when  $n=1$ ,  
L.H.S =  $T(1) = 1$   
R.H.S =  $2 \times 1 - 1 = 1$   
L.H.S  $\leq$  R.H.S

# More example

Prove that  $T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T(\frac{n}{2}) + 1 & \text{otherwise} \end{cases}$  is  $O(n)$

**Guess:**  $T(n) \leq 2n - 1$

Assume true for all  $n' < n$  [assume  $T(\frac{n}{2}) \leq 2 \times (\frac{n}{2}) - 1$ ]

$$\begin{aligned}
 T(n) &= 2 \times T(\frac{n}{2}) + 1 \\
 &\leq 2 \times (2 \times (\frac{n}{2}) - 1) + 1 \quad \leftarrow \text{by hypothesis} \\
 &= 2n - 2 + 1 \\
 &= 2n - 1
 \end{aligned}$$

**i.e.,  $T(n) \leq 2n - 1$**

# Summary

Depending on the recurrence, we can guess the order of growth

$$T(n) = T\left(\frac{n}{2}\right) + 1$$

$T(n)$  is  $O(\log n)$

$$T(n) = 2 \times T\left(\frac{n}{2}\right) + 1$$

$T(n)$  is  $O(n)$

$$T(n) = 2 \times T\left(\frac{n}{2}\right) + n$$

$T(n)$  is  $O(n \log n)$

# Tower of Hanoi ...

# Tower of Hanoi - Initial config

There are three pegs and some discs of different sizes are on Peg A

# Tower of Hanoi - Final config

Want to move the discs to Peg C

A

B

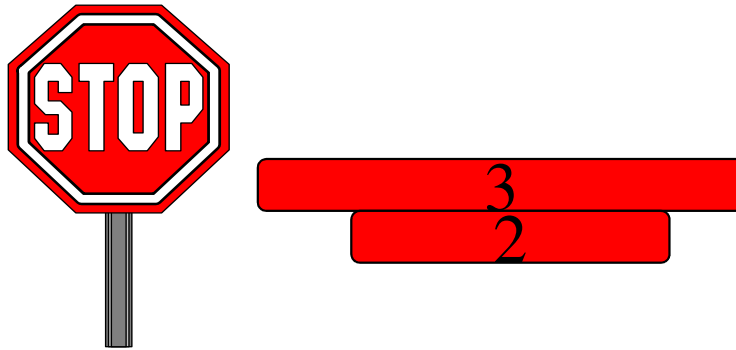

C

# Tower of Hanoi - Rules

Only 1 disk can be moved at a time

A disc cannot be placed on top of other discs that are smaller than it

**Target: Use the smallest number of moves**

# Tower of Hanoi - One disc only

Easy!

# Tower of Hanoi - One disc only

Easy! Need one move only.

# Tower of Hanoi - Two discs

We first need to move Disc-2 to C, How?

by moving Disc-1 to B first, then Disc-2 to C

# Tower of Hanoi - Two discs

Next?

Move Disc-1 to C

# Tower of Hanoi - Two discs

Done!

# Tower of Hanoi - Three discs

We first need to move Disc-3 to C, How?

- Move Disc-1&2 to B (recursively)

# Tower of Hanoi - Three discs

We first need to move Disc-3 to C, How?

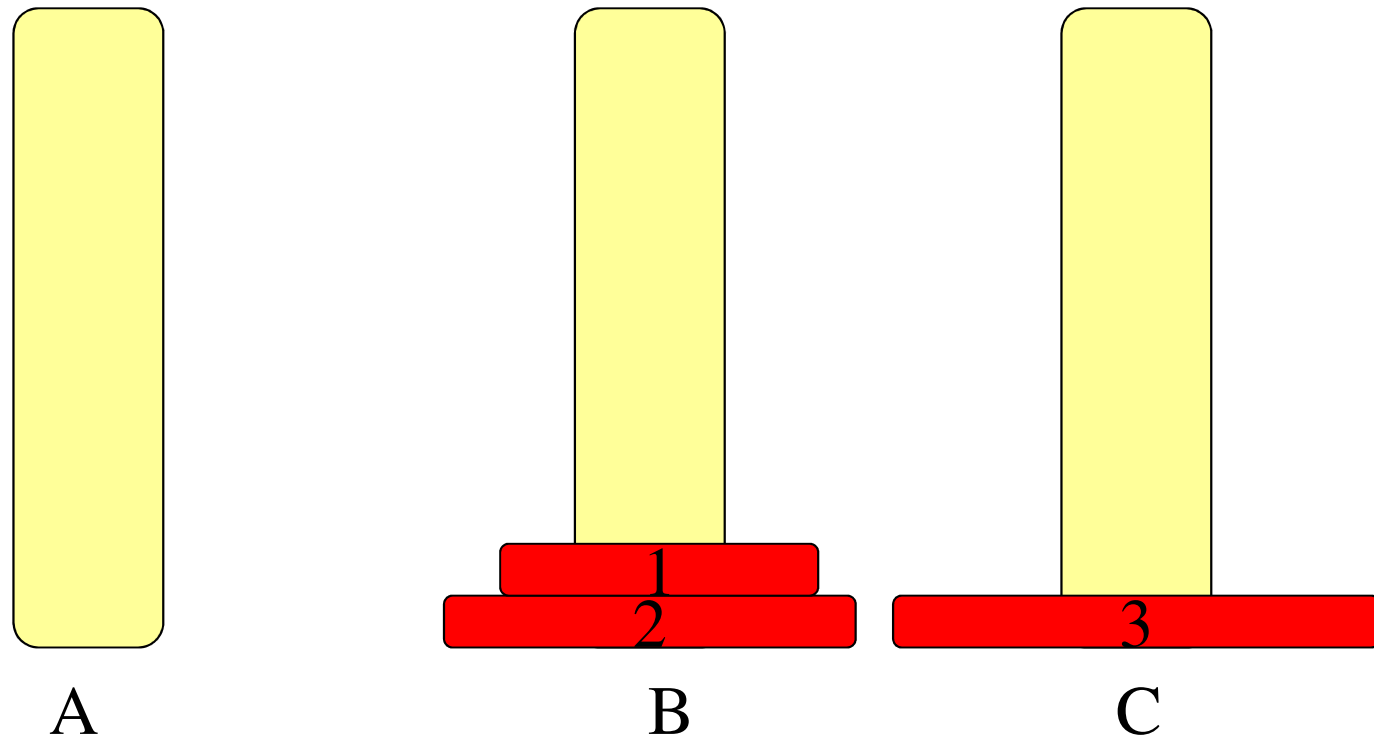

- Move Disc-1&2 to B (recursively)
- Then move Disc-3 to C

# Tower of Hanoi - Three discs

Only task left: move Disc-1&2 to C (similarly as before)

# Tower of Hanoi - **Three** discs

Done!

# Tower of Hanoi

ToH(num\_disc, source, dest, spare)

invoke by calling  
ToH(3, A, C, B)

begin

if (num\_disc > 1) then

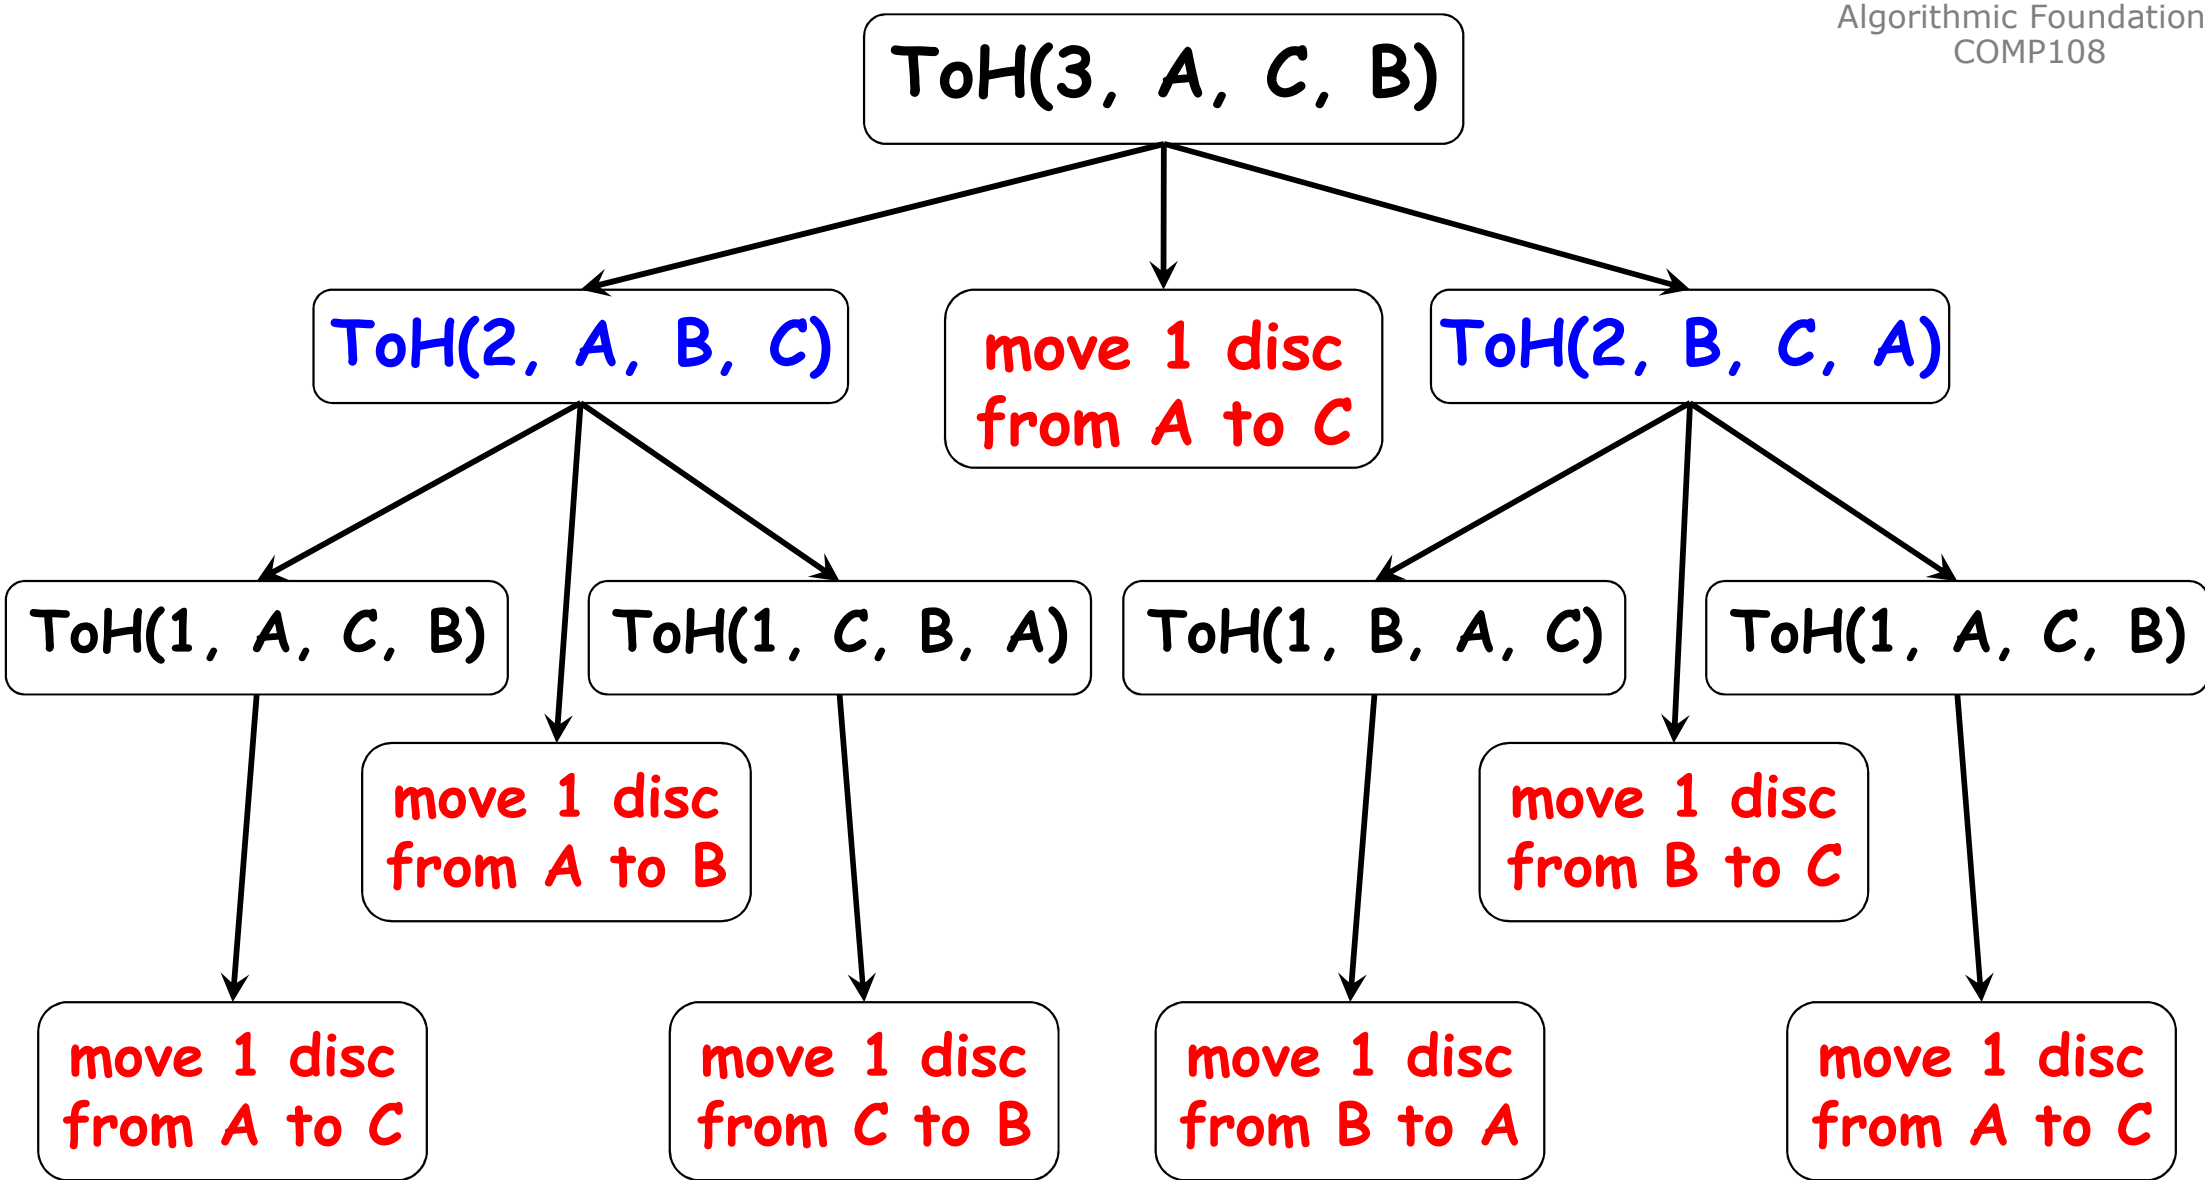

ToH(num\_disc-1, source, spare, dest)

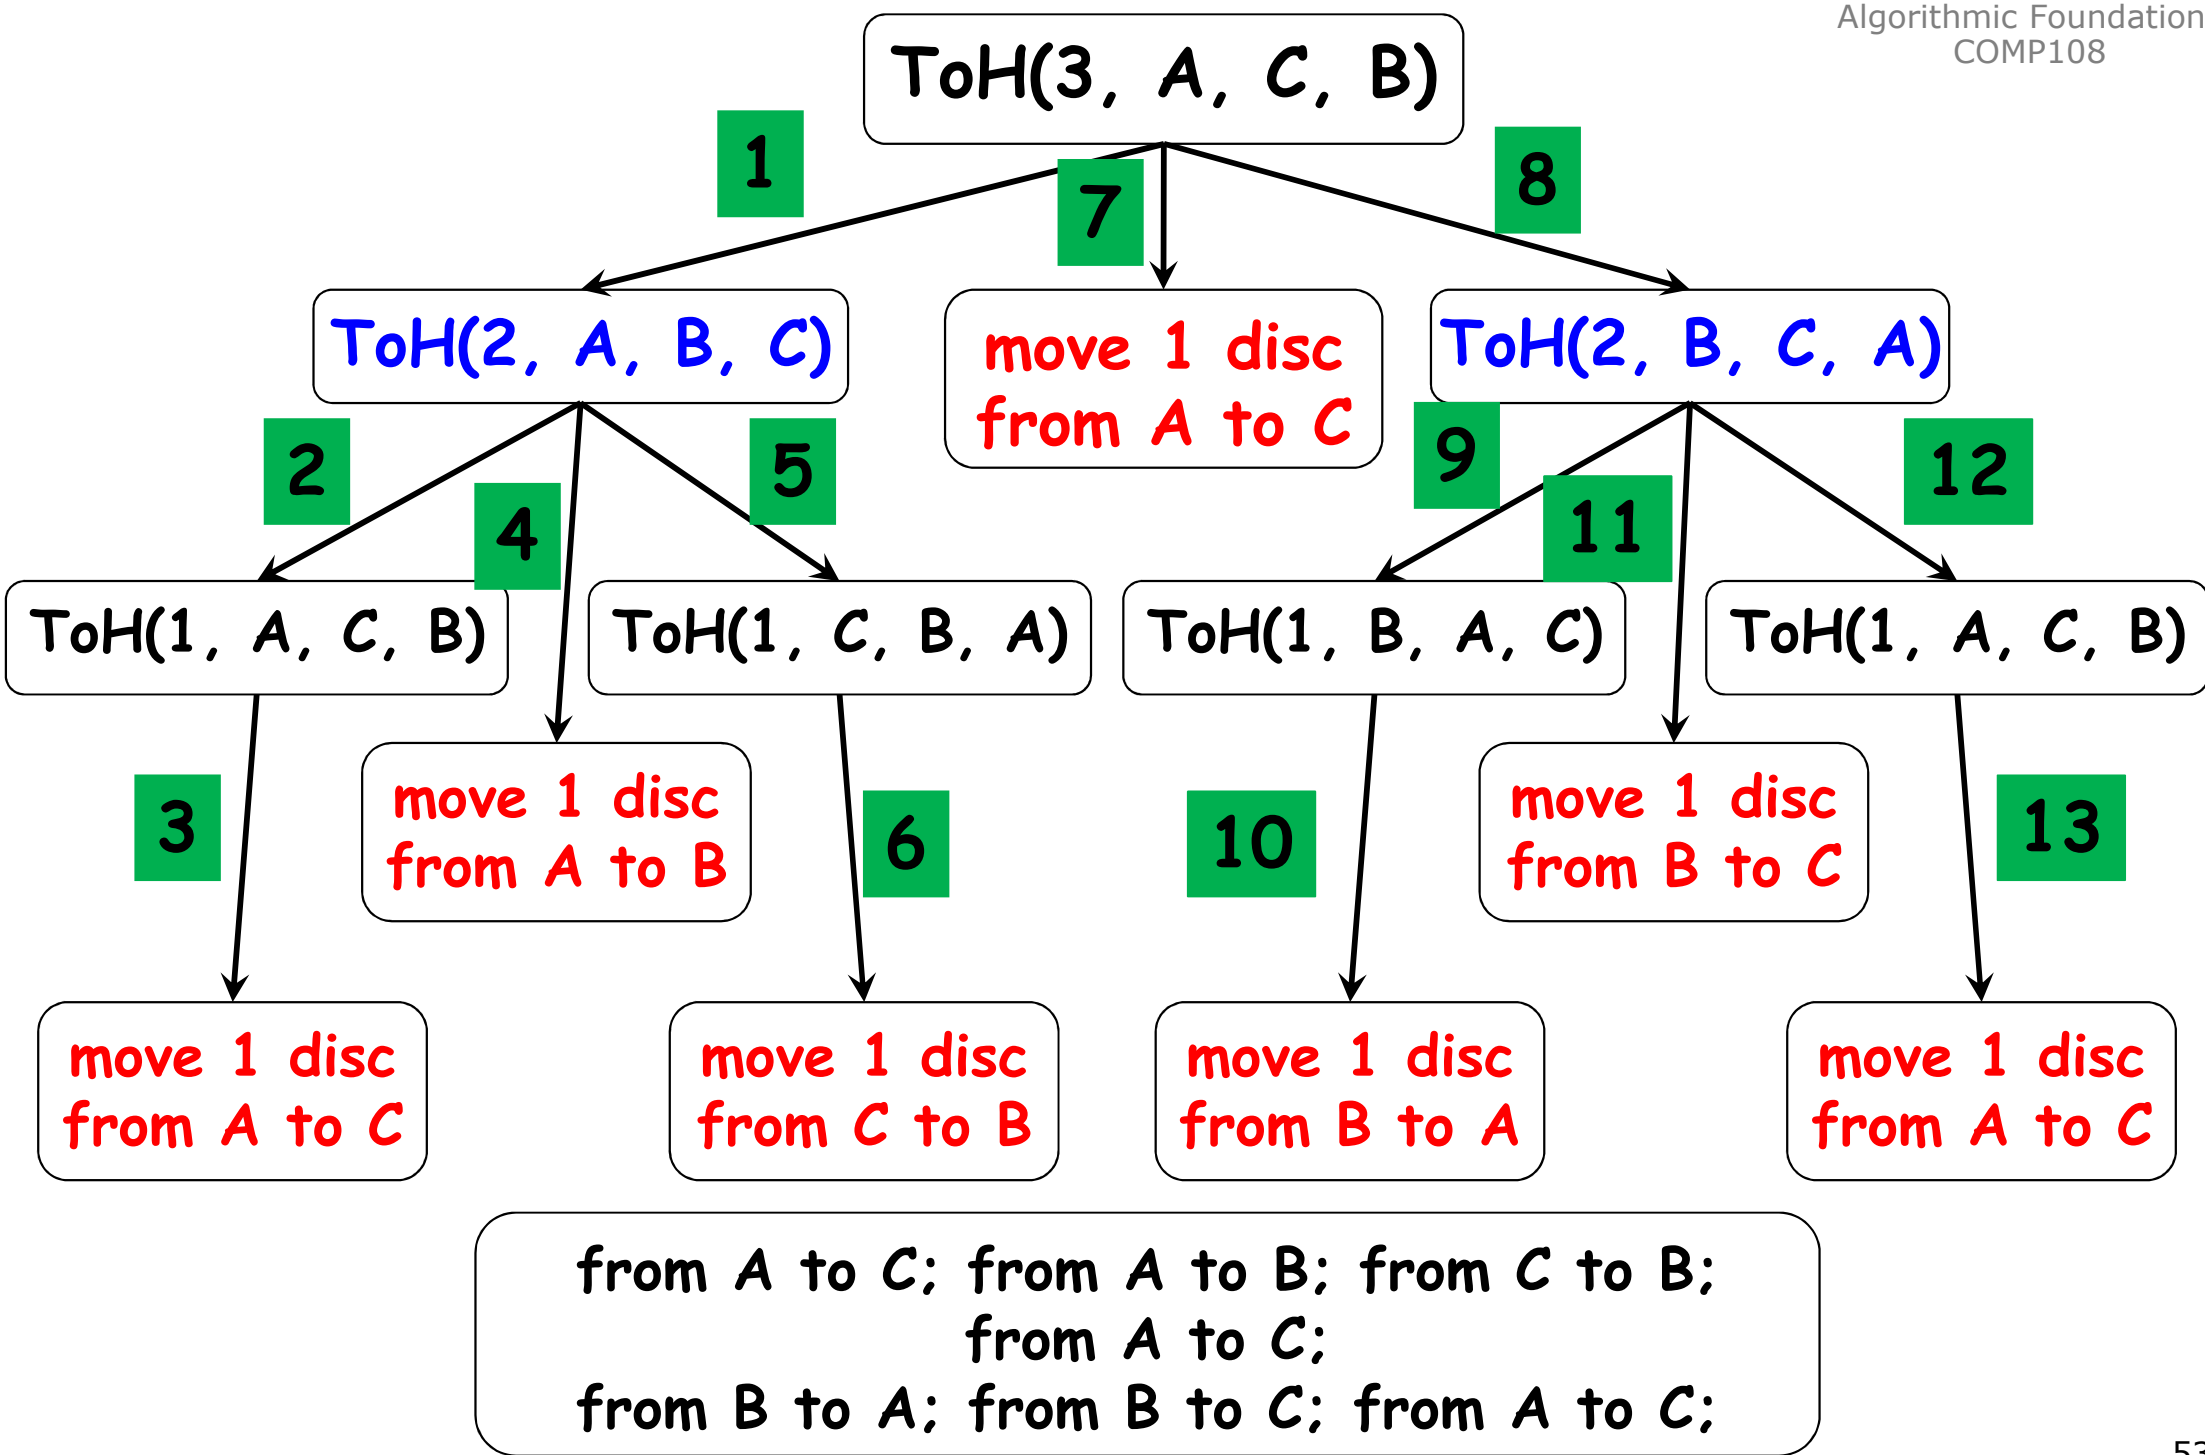

Move the disc from source to dest

if (num\_disc > 1) then

ToH(num\_disc-1, spare, dest, source)

end

# Time complexity

$$T(n) = \underbrace{T(n-1)}_{\substack{\text{move } n-1 \\ \text{discs from} \\ \text{A to B}}} + \underset{\substack{\text{move Disc-}n \\ \text{from A to C}}}{\uparrow} 1 + \underbrace{T(n-1)}_{\substack{\text{move } n-1 \\ \text{discs from} \\ \text{B to C}}}$$

Let  $T(n)$  denote the time complexity of running the Tower of Hanoi algorithm on  $n$  discs.

$$T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T(n-1) + 1 & \text{otherwise} \end{cases}$$

# Time complexity (2)

$$T(n) = 2 \times T(n-1) + 1$$

$$= 2[2 \times T(n-2) + 1] + 1$$

$$T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T(n-1) + 1 & \text{otherwise} \end{cases}$$

$$= 2^2 T(n-2) + 2 + 1$$

$$= 2^2 [2 \times T(n-3) + 1] + 2^1 + 2^0$$

$$= 2^3 T(n-3) + 2^2 + 2^1 + 2^0$$

...

$$= 2^k T(n-k) + 2^{k-1} + 2^{k-2} + \dots + 2^2 + 2^1 + 2^0$$

...

$$= 2^{n-1} T(1) + 2^{n-2} + 2^{n-3} + \dots + 2^2 + 2^1 + 2^0$$

$$= 2^{n-1} + 2^{n-2} + 2^{n-3} + \dots + 2^2 + 2^1 + 2^0$$

$$= 2^n - 1$$

i.e.,  $T(n)$  is  $O(2^n)$

In Tutorial 2, we prove by MI that  
 $2^0 + 2^1 + \dots + 2^{n-1} = 2^n - 1$

iterative  
method

# Summary - continued

Depending on the recurrence, we can guess the order of growth

$$T(n) = T\left(\frac{n}{2}\right) + 1 \quad T(n) \text{ is } O(\log n)$$

$$T(n) = 2 \times T\left(\frac{n}{2}\right) + 1 \quad T(n) \text{ is } O(n)$$

$$T(n) = 2 \times T\left(\frac{n}{2}\right) + n \quad T(n) \text{ is } O(n \log n)$$

$$T(n) = 2 \times T(n-1) + 1 \quad T(n) \text{ is } O(2^n)$$

# Fibonacci number ...

# Fibonacci's Rabbits

A pair of rabbits, one month old, is too young to reproduce.  
Suppose that in their second month, and every month thereafter, they produce a new pair.

How many  
at end of  
month-5, 6, 7  
and so on?

# Petals on flowers

**1 petal:  
white calla lily**

**2 petals:  
euphorbia**

# Fibonacci number

Fibonacci number  $F(n)$

$$F(n) = \begin{cases} 1 & \text{if } n = 0 \text{ or } 1 \\ F(n-1) + F(n-2) & \text{if } n > 1 \end{cases}$$

|      |   |   |   |   |   |   |    |    |    |    |    |
|------|---|---|---|---|---|---|----|----|----|----|----|
| n    | 0 | 1 | 2 | 3 | 4 | 5 | 6  | 7  | 8  | 9  | 10 |
| F(n) | 1 | 1 | 2 | 3 | 5 | 8 | 13 | 21 | 34 | 55 | 89 |

Pseudo code for the recursive algorithm:

**Algorithm F (n)**

**if**  $n==0$  or  $n==1$  **then**

**return** 1

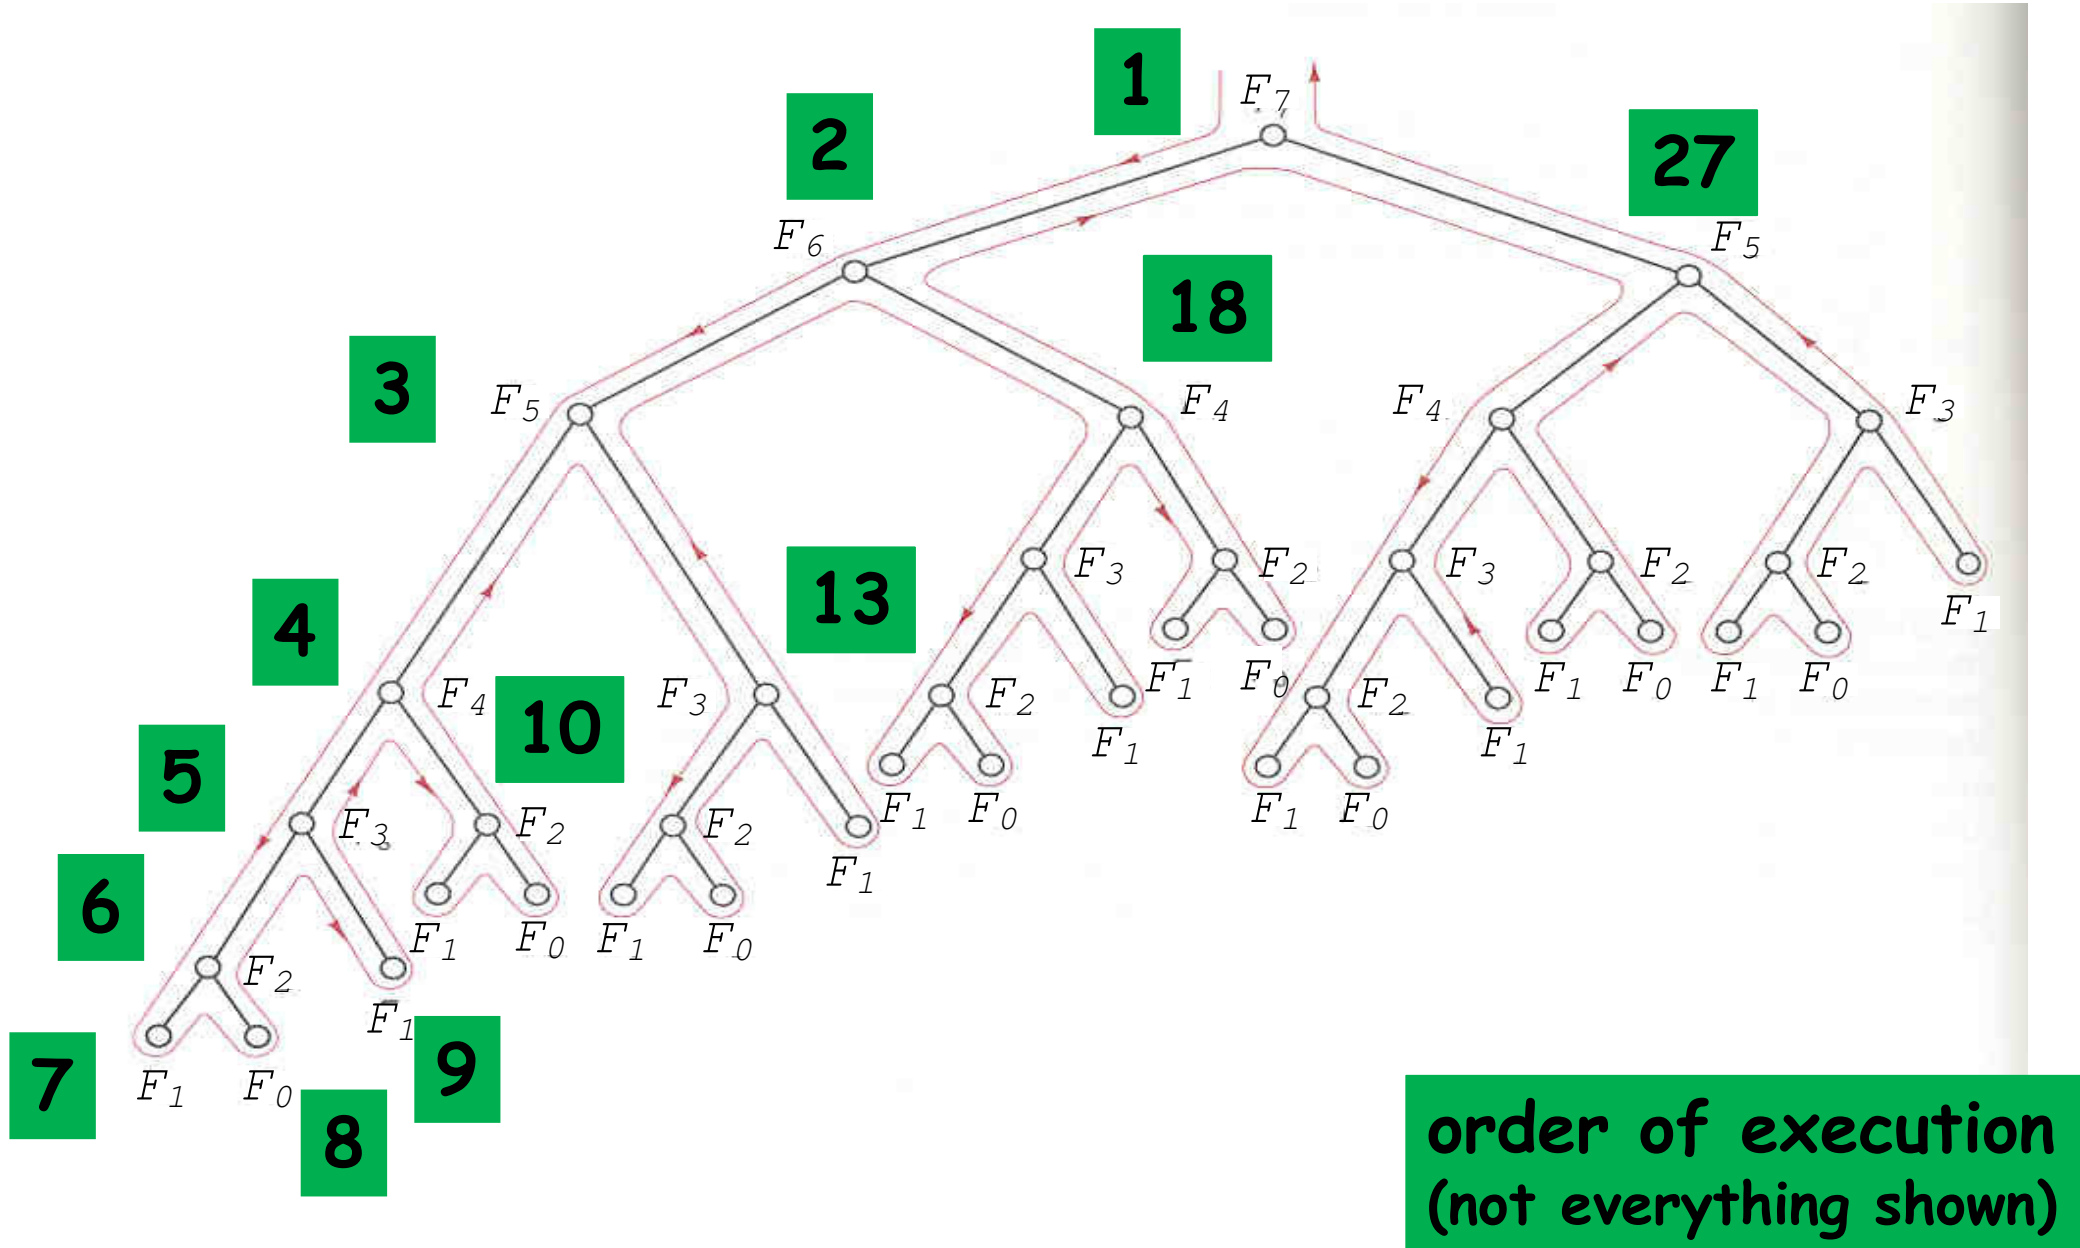

**else**

**return**  $F(n-1) + F(n-2)$

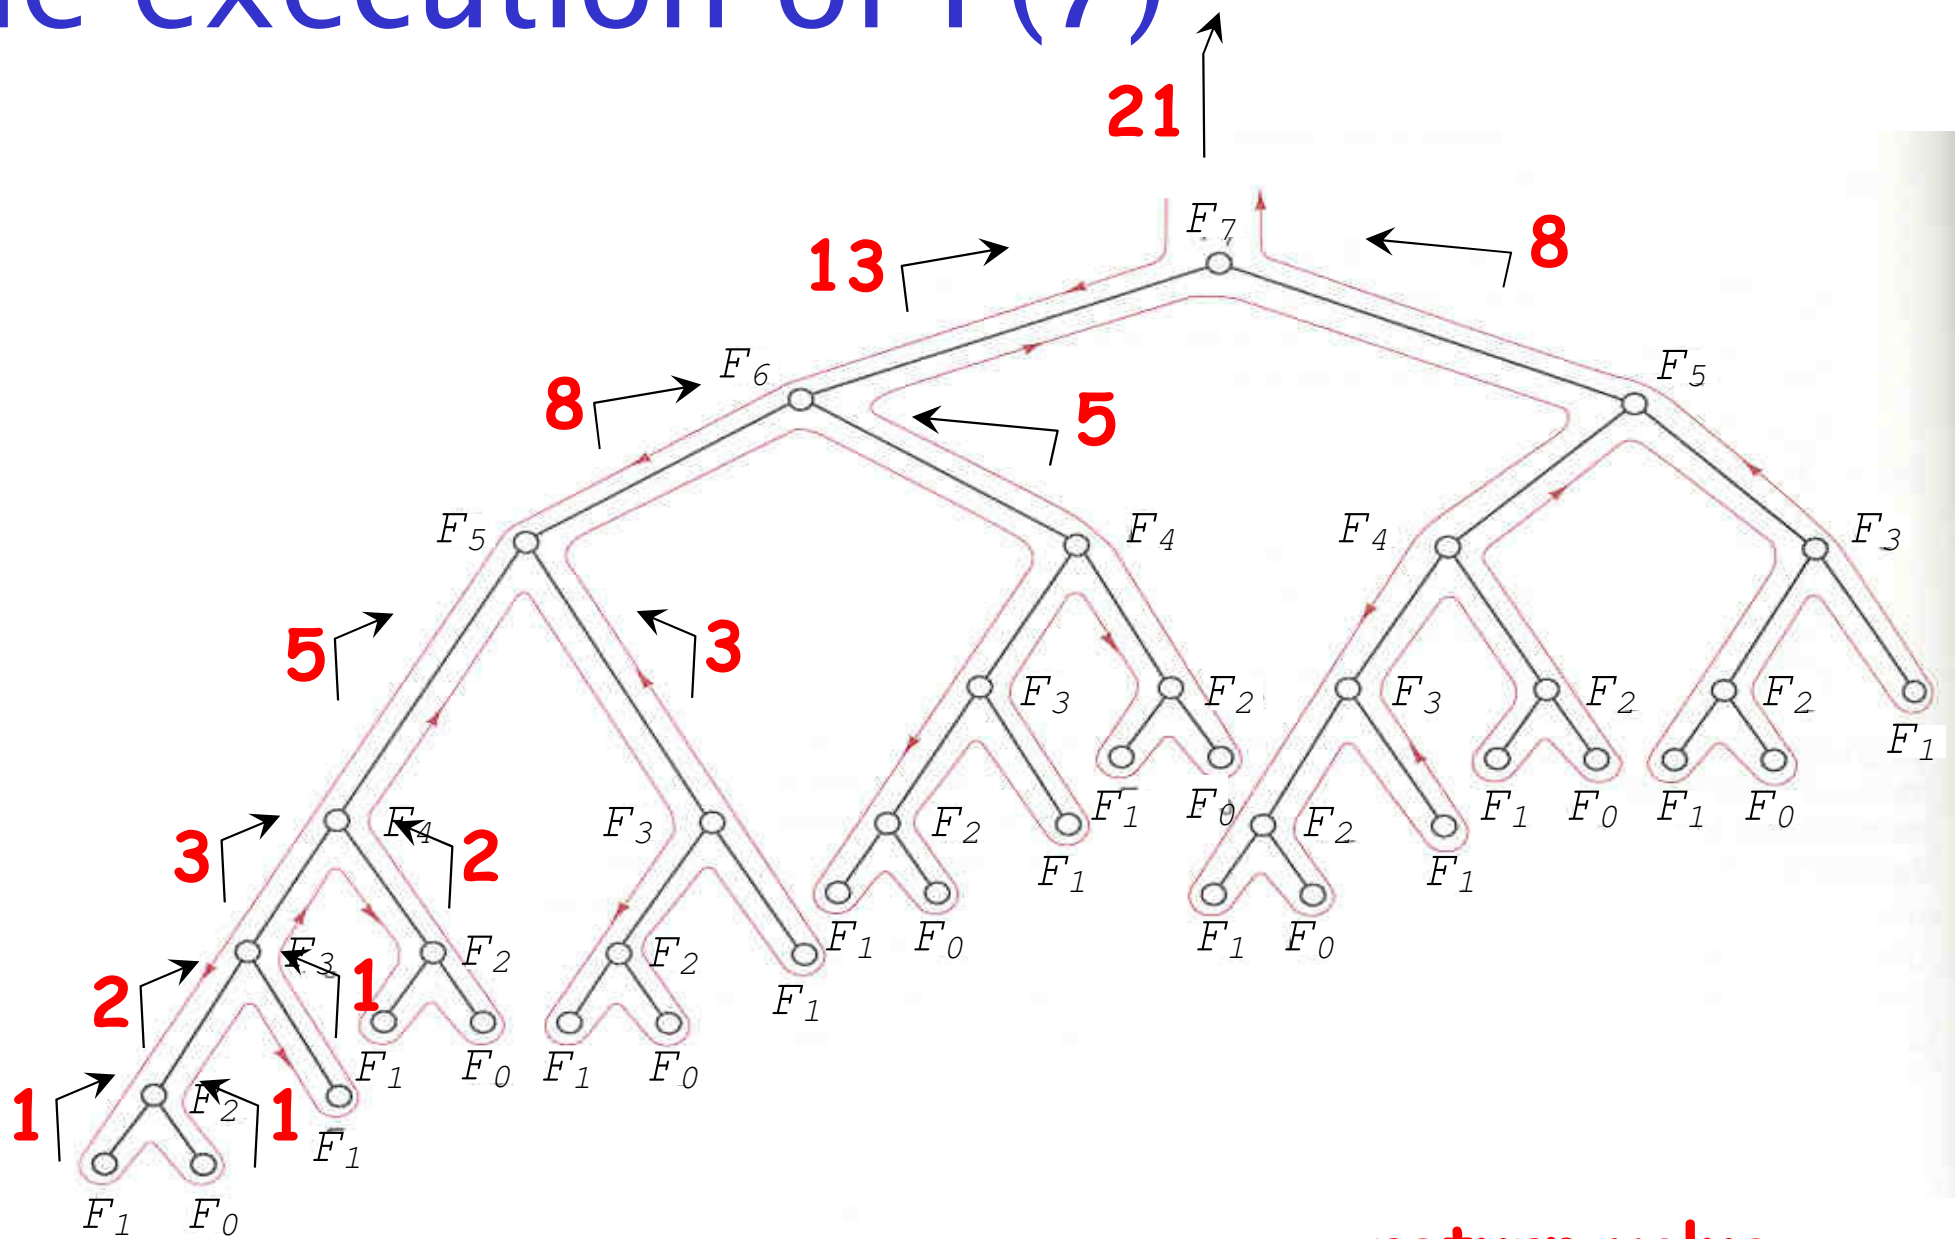

# The execution of $F(7)$

# The execution of $F(7)$

# The execution of $F(7)$

return value  
(not everything shown)

# Time complexity - exponential

$$\begin{aligned}
 f(n) &= \underbrace{f(n-1) + f(n-2)} + 1 \\
 &= [f(n-2) + f(n-3) + 1] + f(n-2) + 1 \\
 &> 2 \underbrace{f(n-2)} \\
 &> 2 [2 \times f(n-2-2)] = 2^2 \underbrace{f(n-4)} \\
 &> 2^2 [2 \times f(n-4-2)] = 2^3 \underbrace{f(n-6)} \\
 &> 2^3 [2 \times f(n-6-2)] = 2^4 \underbrace{f(n-8)} \\
 &\dots \\
 &> 2^k f(n-2k)
 \end{aligned}$$

Suppose  $f(n)$  denote the time complexity to compute  $F(n)$

exponential in  $n$

If  $n$  is even,  $f(n) > 2^{n/2} f(0) = 2^{n/2}$   
 If  $n$  is odd,  $f(n) > f(n-1) > 2^{(n-1)/2}$

# Robozzle - Recursion

**Task:** to program a robot to pick up all stars in a certain area

**Command:** Go straight, Turn Left, Turn Right
