

# Python Programming @ The department of Computer Science

## Circle Calculation

### Requirements

To produce a Python program that calculates and outputs the circumference and area of a circle given its radius. Assume that the radius is input by the user as a double. Area of a circle =  $\pi \times \text{radius}^2$ , and Circumference =  $2 \times \pi \times \text{radius}$  (see Figure ). (Use the constant `pi` from the python `math` module.)

### Testing

Test Case	Expected Result	
Radius	Circumference	Area
10.0	62.831853	314.159
0.0	0.000000	0.000000
-10.0	-62.831853	314.159
