Giant Letters

Requirements

Design and implement a Python program that writes “JAVA” vertically down the screen using giant letters made up of strings of * characters and blank spaces as shown. (Do not use the "tab" character!)

Hint

Define a separate function for each letter.

Note

To output a string of * characters you can use:

```
Print("*******")
```

(double quotes) or:

```
Print('*******')
```

(single quotes).

Software programmes take “input” and transform it into “output”.

In the case of our giant letters programme the input was simply an instruction to run the code. Clearly to do anything more meaningful we need more sophisticated input.
