

# COMP108 Algorithmic Foundations

Divide and Conquer

Prudence Wong

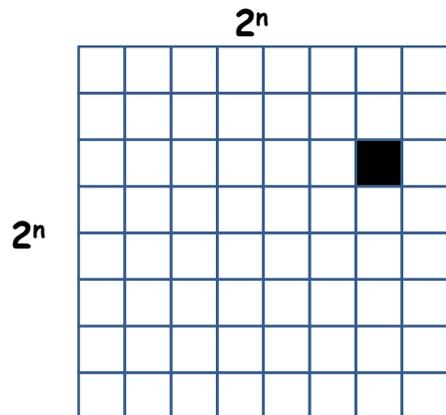

## Pancake Sorting

**Input:** Stack of pancakes, each of **different** sizes  
**Output:** Arrange in **order of size** (smallest on top)  
**Action:** Slip a **flipper** under one of the pancakes and **flip** over the **whole stack** above the flipper

## Triomino Puzzle

**Input:**  $2^n$ -by- $2^n$  chessboard with **one** missing square & many **L-shaped** tiles of **3** adjacent squares  
**Question:** **Cover** the chessboard with L-shaped tiles without overlapping

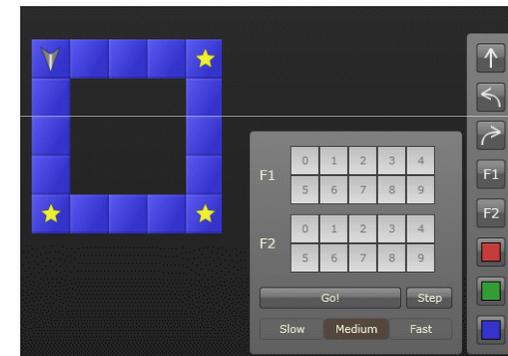

Is it do-able?

## Robozzle - Recursion

**Task:** to program a robot to pick up all stars in a certain area  
**Command:** Go straight, Turn Left, Turn Right

## Divide and Conquer ...

## Learning outcomes

- Understand how divide and conquer works and able to analyse complexity of divide and conquer methods by solving recurrence
- See examples of divide and conquer methods

6

(Divide & Conquer)

## Divide and Conquer

One of the **best-known** algorithm design techniques

Idea:

- A problem instance is **divided** into several **smaller** instances of the same problem, ideally of about same size
- The smaller instances are **solved**, typically **recursively**
- The solutions for the smaller instances are **combined** to get a solution to the large instance

7

(Divide & Conquer)

## Merge Sort ...

# Merge sort

- using divide and conquer technique
- divide the sequence of n numbers into two halves
- **recursively** sort the two halves
- **merge** the two sorted halves into a single sorted sequence

9

(Divide & Conquer)

51, 13, 10, 64, 34, 5, 32, 21

we want to sort these 8 numbers,  
**divide** them into two halves

10

(Divide & Conquer)

51, 13, 10, 64, 34, 5, 32, 21

51, 13, 10, 64

34, 5, 32, 21

**divide** these 4  
numbers into  
halves

similarly for  
these 4

11

(Divide & Conquer)

51, 13, 10, 64, 34, 5, 32, 21

51, 13, 10, 64

34, 5, 32, 21

51, 13

10, 64

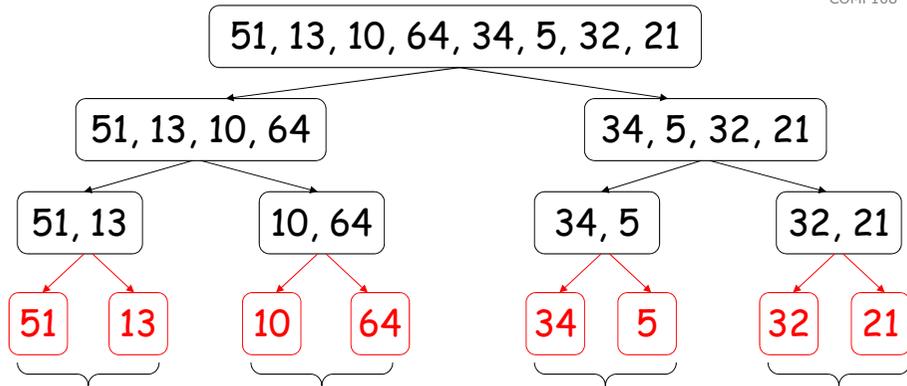

34, 5

32, 21

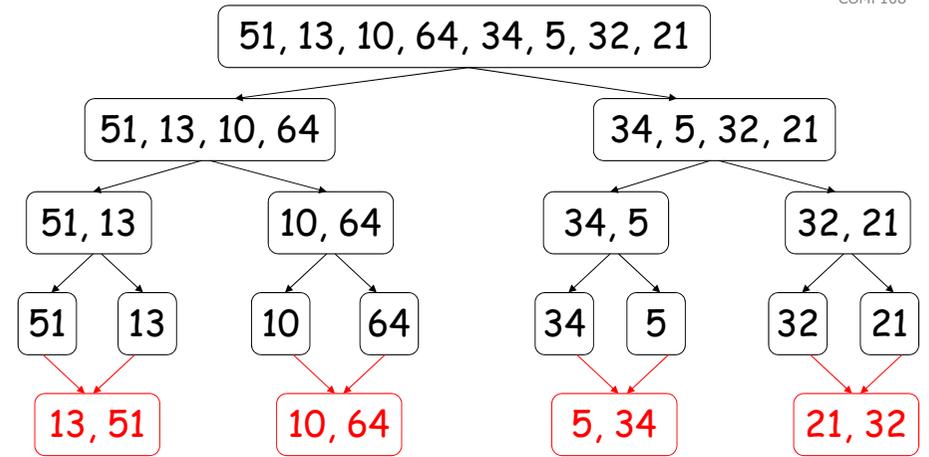

further divide each shorter sequence ...  
until we get sequence with only **1** number

12

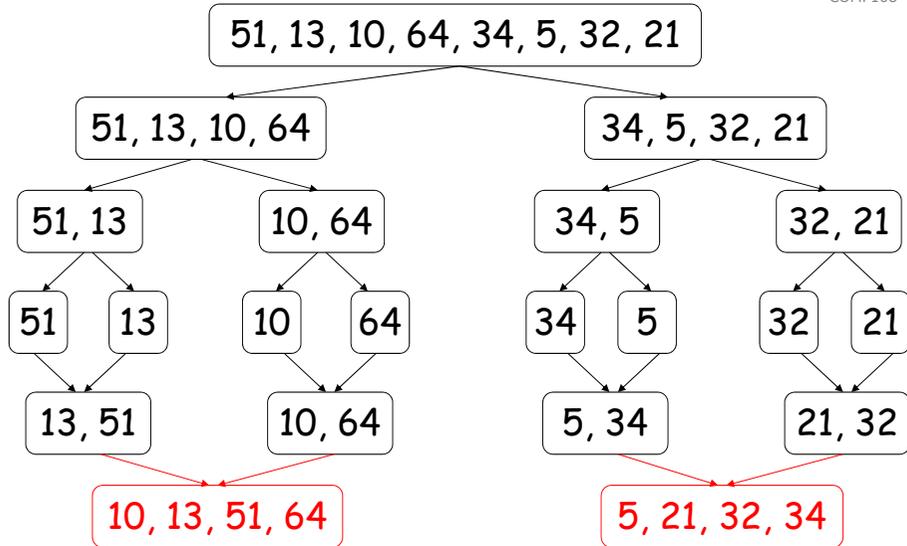

(Divide & Conquer)

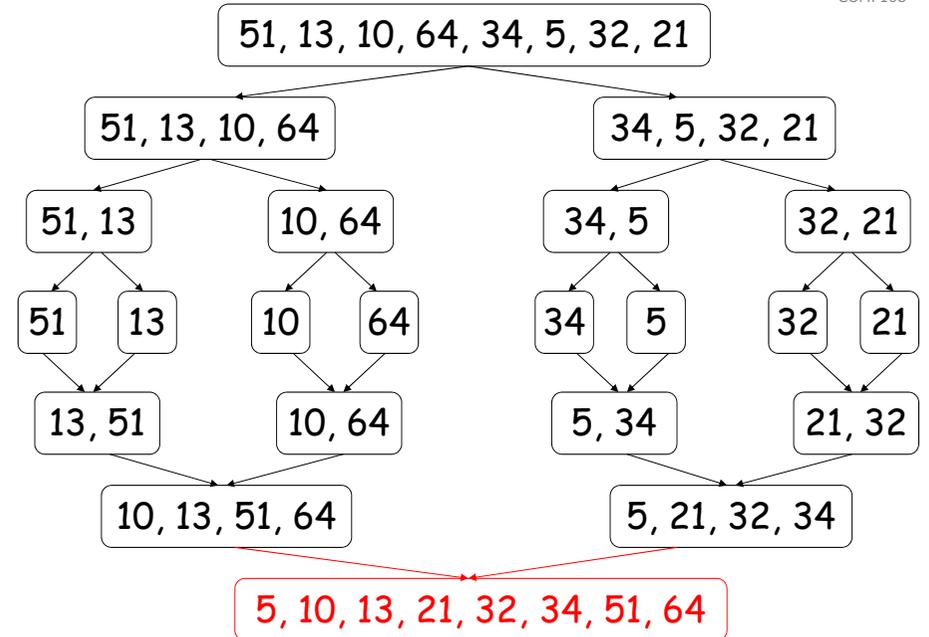

merge pairs of single number into a sequence of 2 sorted numbers

then merge again into sequences of 4 sorted numbers

one more merge give the final sorted sequence

5, 10, 13, 21, 32, 34, 51, 64

# Summary

## Divide

- dividing a sequence of  $n$  numbers into **two** smaller sequences is straightforward

## Conquer

- merging two sorted sequences of **total length  $n$**  can also be done easily, at most  **$n-1$**  comparisons

17

(Divide & Conquer)

10, 13, 51, 64

5, 21, 32, 34

Result:

To merge two sorted sequences, we keep two **pointers**, one to each sequence

Compare the two numbers pointed, copy the **smaller** one to the result and **advance** the corresponding pointer

18

(Divide & Conquer)

10, 13, 51, 64

5, 21, 32, 34

Result: **5,**

Then compare again the two numbers pointed to by the pointer; copy the smaller one to the result and advance that pointer

19

(Divide & Conquer)

10, 13, 51, 64

5, 21, 32, 34

Result: **5, 10,**

Repeat the same process ...

20

(Divide & Conquer)

10, 13, 51, 64

5, 21, 32, 34

Result: 5, 10, **13**

Again ...

10, 13, 51, 64

5, 21, 32, 34

Result: 5, 10, 13, **21**

and again ...

10, 13, 51, 64

5, 21, 32, 34

Result: 5, 10, 13, 21, **32**

...

10, 13, 51, 64

5, 21, 32, 34

Result: 5, 10, 13, 21, 32, **34**

When we reach the **end** of one sequence,  
simply copy the **remaining** numbers in the other  
sequence to the result

10, 13, 51, 64

5, 21, 32, 34

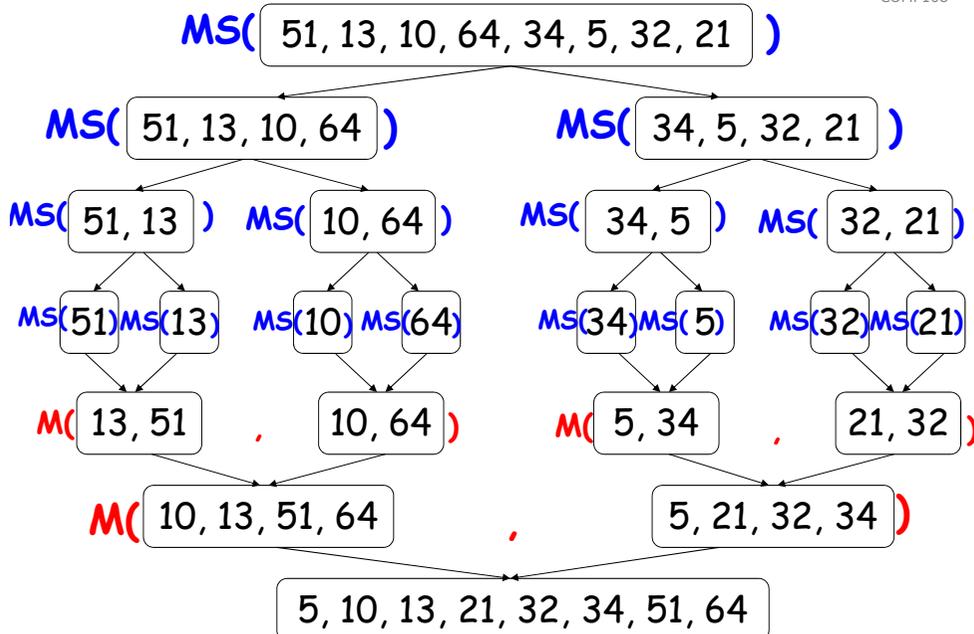

Result: 5, 10, 13, 21, 32, 34, 51, 64

Then we obtain the final sorted sequence

## Pseudo code

```

Algorithm Mergesort(A[1..n])
  if n > 1 then begin
    copy A[1..⌊n/2⌋] to B[1..⌊n/2⌋]
    copy A[⌊n/2⌋+1..n] to C[1..⌈n/2⌉]
    Mergesort(B[1..⌊n/2⌋])
    Mergesort(C[1..⌈n/2⌉])
    Merge(B, C, A)
  end
    
```

## Pseudo code

```

Algorithm Merge(B[1..p], C[1..q], A[1..p+q])
  set i=1, j=1, k=1
  while i<=p and j<=q do
    begin
      if B[i]≤C[j] then
        set A[k] = B[i] and i = i+1
      else set A[k] = C[j] and j = j+1
      k = k+1
    end
  if i==p+1 then copy C[j..q] to A[k..(p+q)]
  else copy B[i..p] to A[k..(p+q)]
    
```

p=4

B: 10, 13, 51, 64

q=4

C: 5, 21, 32, 34

	i	j	k	A[ ]
Before loop	1	1	1	empty
End of 1st iteration	1	2	2	5
End of 2nd iteration	2	2	3	5, 10
End of 3rd	3	2	4	5, 10, 13
End of 4th	3	3	5	5, 10, 13, 21
End of 5th	3	4	6	5, 10, 13, 21, 32
End of 6th	3	5	7	5, 10, 13, 21, 32, 34
				5, 10, 13, 21, 32, 34, 51, 64

29

(Divide & Conquer)

## Time complexity

Let  $T(n)$  denote the time complexity of running merge sort on  $n$  numbers.

$$T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T(n/2) + n & \text{otherwise} \end{cases}$$

We call this formula a **recurrence**.

A recurrence is an equation or inequality that describes a function in terms of **its value on smaller inputs**.

To **solve** a recurrence is to derive **asymptotic bounds** on the solution

30

(Divide & Conquer)

## Time complexity

Prove that  $T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T(n/2) + n & \text{otherwise} \end{cases}$  is  $O(n \log n)$

**Make a guess:**  $T(n) \leq 2 n \log n$  (We prove by MI)

For the base case when  $n=2$ ,  
L.H.S =  $T(2) = 2 \times T(1) + 2 = 4$ ,  
R.H.S =  $2 \times 2 \log 2 = 4$   
L.H.S  $\leq$  R.H.S

**Substitution method**

31

(Divide & Conquer)

## Time complexity

Prove that  $T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T(n/2) + n & \text{otherwise} \end{cases}$  is  $O(n \log n)$

**Make a guess:**  $T(n) \leq 2 n \log n$  (We prove by MI)

Assume true for all  $n' < n$  [assume  $T(n/2) \leq 2 (n/2) \log(n/2)$ ]

$$\begin{aligned} T(n) &= 2 \times T(n/2) + n && \text{by hypothesis} \\ &\leq 2 \times (2 \times (n/2) \times \log(n/2)) + n \\ &= 2 n (\log n - 1) + n \\ &= 2 n \log n - 2n + n \\ &\leq 2 n \log n \end{aligned}$$

**i.e.,  $T(n) \leq 2 n \log n$**

32

(Divide & Conquer)

## Example

$$T(n) = \begin{cases} 1 & \text{if } n=1 \\ T(n/2) + 1 & \text{otherwise} \end{cases}$$

Guess:  $T(n) \leq 2 \log n$

For the base case when  $n=2$ ,  
 L.H.S =  $T(2) = T(1) + 1 = 2$   
 R.H.S =  $2 \log 2 = 2$   
 L.H.S  $\leq$  R.H.S

33

(Divide & Conquer)

## Example

$$T(n) = \begin{cases} 1 & \text{if } n=1 \\ T(n/2) + 1 & \text{otherwise} \end{cases}$$

Guess:  $T(n) \leq 2 \log n$

Assume true for all  $n' < n$  [assume  $T(n/2) \leq 2 \times \log(n/2)$ ]

$$\begin{aligned} T(n) &= T(n/2) + 1 \\ &\leq 2 \times \log(n/2) + 1 \leftarrow \text{by hypothesis} \\ &= 2 \times (\log n - 1) + 1 \leftarrow \log(n/2) = \log n - \log 2 \\ &< 2 \log n \end{aligned}$$

**i.e.,  $T(n) \leq 2 \log n$**

34

(Divide & Conquer)

## More example

Prove that  $T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T(n/2) + 1 & \text{otherwise} \end{cases}$  is  $O(n)$

Guess:  $T(n) \leq 2n - 1$

For the base case when  $n=1$ ,  
 L.H.S =  $T(1) = 1$   
 R.H.S =  $2 \times 1 - 1 = 1$   
 L.H.S  $\leq$  R.H.S

35

(Divide & Conquer)

## More example

Prove that  $T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T(n/2) + 1 & \text{otherwise} \end{cases}$  is  $O(n)$

Guess:  $T(n) \leq 2n - 1$

Assume true for all  $n' < n$  [assume  $T(n/2) \leq 2(n/2) - 1$ ]

$$\begin{aligned} T(n) &= 2 \times T(n/2) + 1 \\ &\leq 2 \times (2 \times (n/2) - 1) + 1 \leftarrow \text{by hypothesis} \\ &= 2n - 2 + 1 \\ &= 2n - 1 \end{aligned}$$

**i.e.,  $T(n) \leq 2n - 1$**

36

(Divide & Conquer)

# Summary

Depending on the recurrence, we can guess the order of growth

$$T(n) = T(n/2)+1 \quad T(n) \text{ is } O(\log n)$$

$$T(n) = 2 \times T(n/2)+1 \quad T(n) \text{ is } O(n)$$

$$T(n) = 2 \times T(n/2)+n \quad T(n) \text{ is } O(n \log n)$$

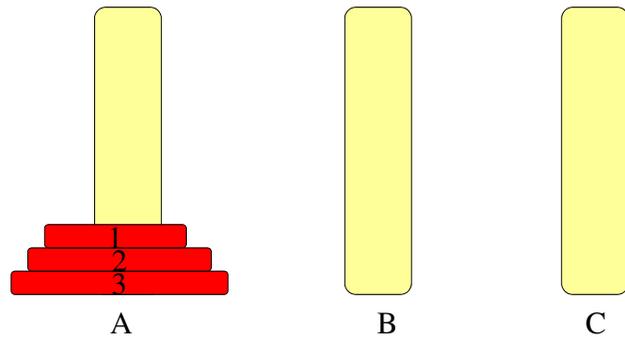

37

(Divide & Conquer)

# Tower of Hanoi ...

# Tower of Hanoi - Initial config

There are three pegs and some discs of different sizes are on Peg A

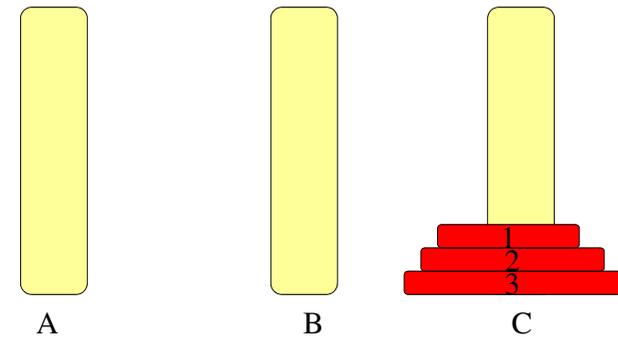

39

(Divide & Conquer)

# Tower of Hanoi - Final config

Want to move the discs to Peg C

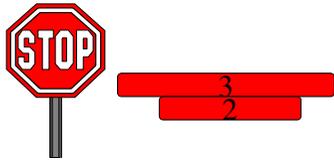

40

(Divide & Conquer)

## Tower of Hanoi - Rules

Only 1 disk can be moved at a time

A disc cannot be placed on top of other discs that are smaller than it

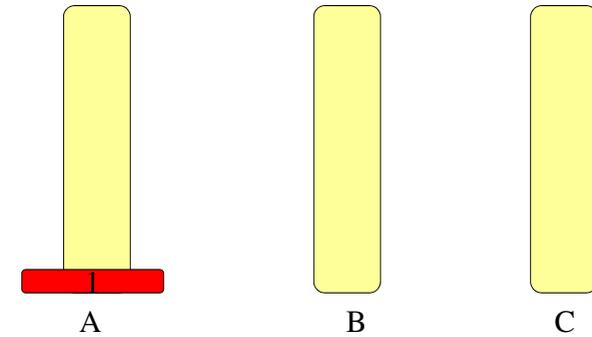

**Target: Use the smallest number of moves**

41

(Divide & Conquer)

## Tower of Hanoi - One disc only

Easy!

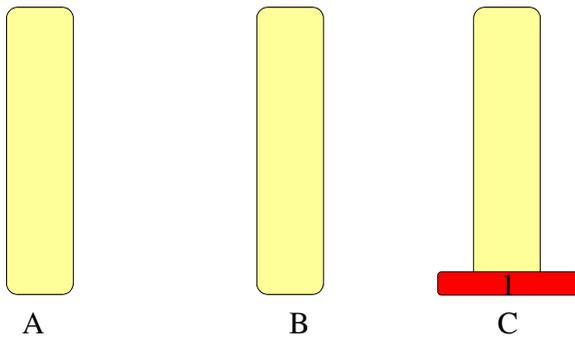

42

(Divide & Conquer)

## Tower of Hanoi - One disc only

Easy! Need one move only.

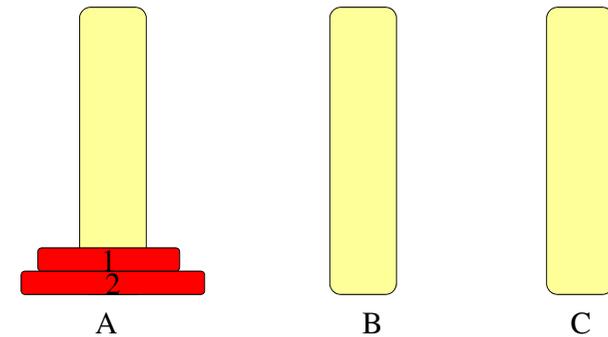

43

(Divide & Conquer)

## Tower of Hanoi - Two discs

We first need to move Disc-2 to C, How?  
by moving Disc-1 to B first, then Disc-2 to C

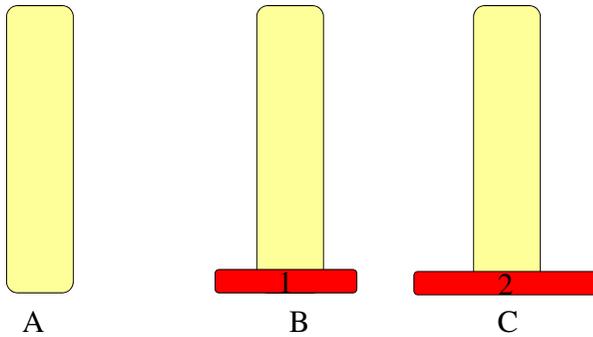

44

(Divide & Conquer)

# Tower of Hanoi - Two discs

Next?

Move Disc-1 to C

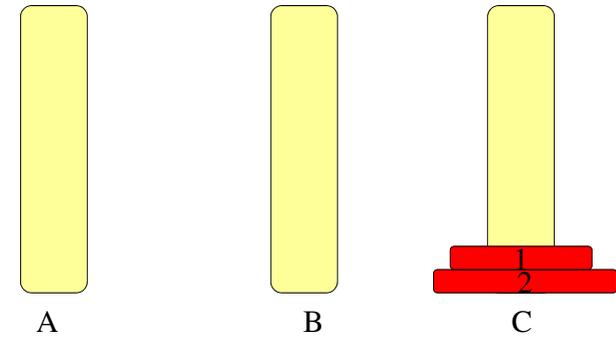

45

(Divide & Conquer)

# Tower of Hanoi - Two discs

Done!

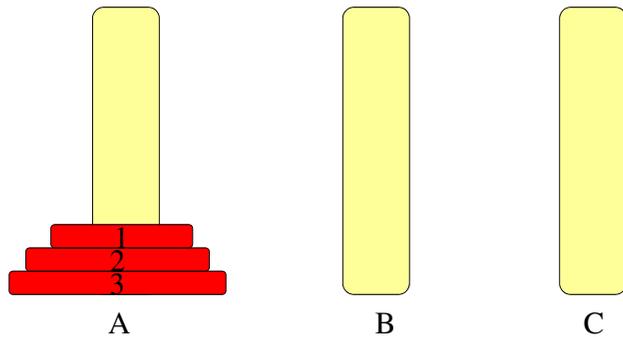

46

(Divide & Conquer)

# Tower of Hanoi - Three discs

We first need to move Disc-3 to C, How?

- Move Disc-1&2 to B (recursively)

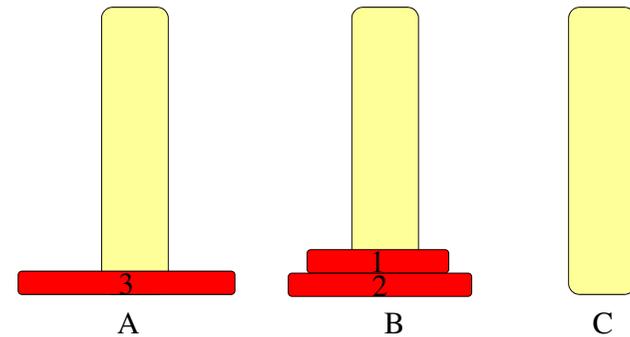

47

(Divide & Conquer)

# Tower of Hanoi - Three discs

We first need to move Disc-3 to C, How?

- Move Disc-1&2 to B (recursively)
- Then move Disc-3 to C

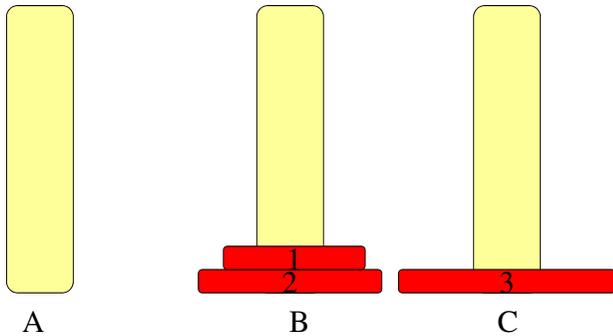

48

(Divide & Conquer)

# Tower of Hanoi - Three discs

Only task left: move Disc-1&2 to C (similarly as before)

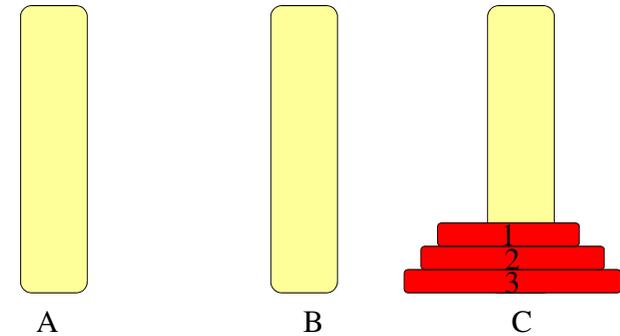

49

(Divide & Conquer)

# Tower of Hanoi - Three discs

Done!

50

(Divide & Conquer)

# Tower of Hanoi

ToH(num\_disc, source, dest, spare)

invoke by calling  
ToH(3, A, C, B)

begin

if (num\_disc > 1) then

ToH(num\_disc-1, source, spare, dest)

Move the disc from source to dest

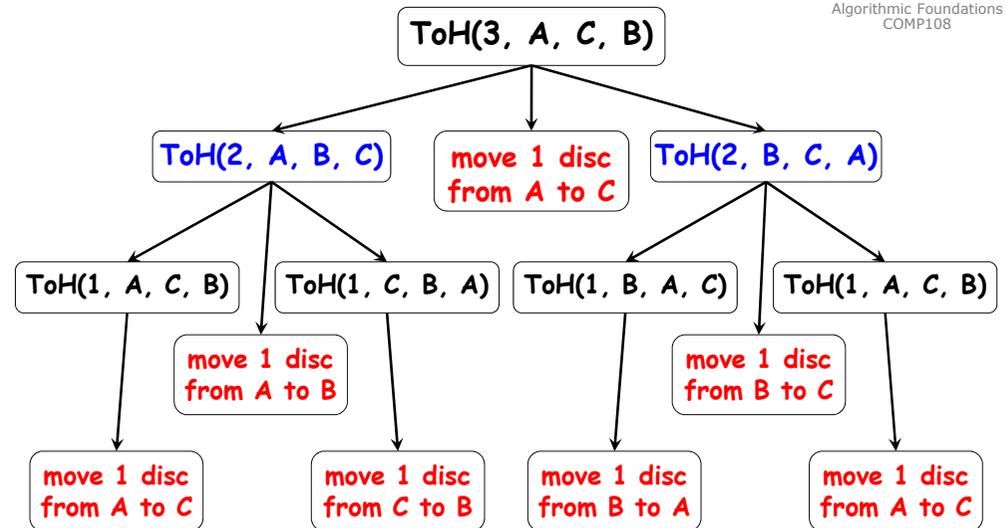

if (num\_disc > 1) then

ToH(num\_disc-1, spare, dest, source)

end

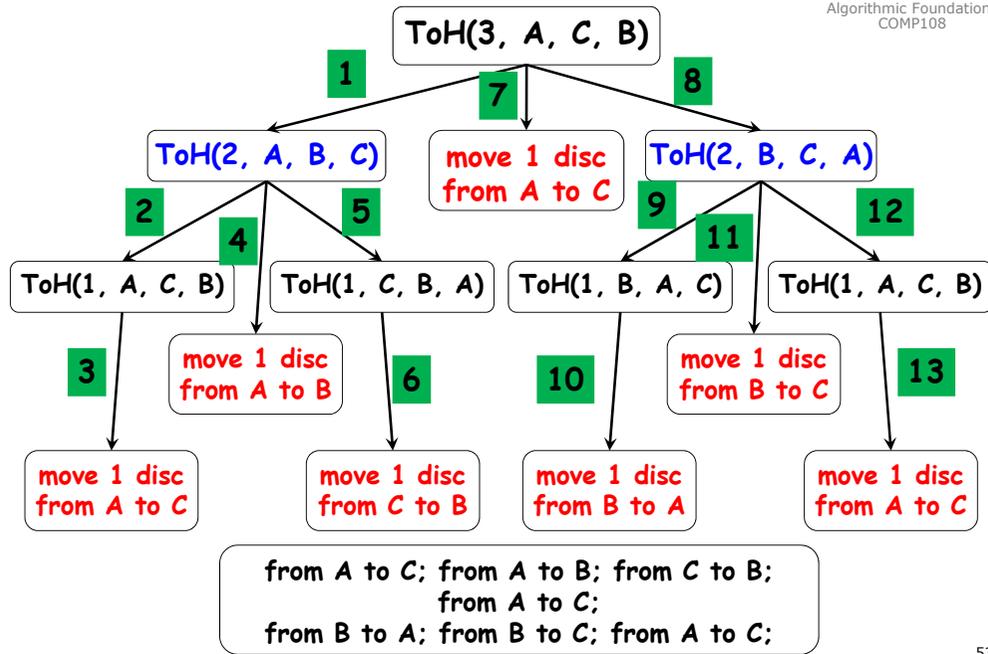

51

(Divide & Conquer)

52

(Divide & Conquer)

53

(Divide & Conquer)

## Time complexity

Let  $T(n)$  denote the time complexity of running the Tower of Hanoi algorithm on  $n$  discs.

$$T(n) = \underbrace{T(n-1)}_{\text{move } n-1 \text{ discs from } A \text{ to } B} + 1 + \underbrace{T(n-1)}_{\text{move } n-1 \text{ discs from } B \text{ to } C}$$

↑  
move Disc- $n$  from A to C

$$T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T(n-1) + 1 & \text{otherwise} \end{cases}$$

54

(Divide & Conquer)

## Time complexity (2)

$$\begin{aligned} T(n) &= 2 \times T(n-1) + 1 \\ &= 2[2 \times T(n-2) + 1] + 1 \\ &= 2^2 T(n-2) + 2 + 1 \\ &= 2^2 [2 \times T(n-3) + 1] + 2^1 + 2^0 \\ &= 2^3 T(n-3) + 2^2 + 2^1 + 2^0 \\ &\dots \\ &= 2^k T(n-k) + 2^{k-1} + 2^{k-2} + \dots + 2^2 + 2^1 + 2^0 \\ &\dots \\ &= 2^{n-1} T(1) + 2^{n-2} + 2^{n-3} + \dots + 2^2 + 2^1 + 2^0 \\ &= 2^{n-1} + 2^{n-2} + 2^{n-3} + \dots + 2^2 + 2^1 + 2^0 \\ &= 2^n - 1 \end{aligned}$$

$T(n) = \begin{cases} 1 & \text{if } n=1 \\ 2 \times T(n-1) + 1 & \text{otherwise} \end{cases}$

i.e.,  $T(n)$  is  $O(2^n)$

iterative method

In Tutorial 2, we prove by MI that  $2^0 + 2^1 + \dots + 2^{n-1} = 2^n - 1$

55

(Divide & Conquer)

## Summary - continued

Depending on the recurrence, we can guess the order of growth

$$T(n) = T(n/2) + 1 \quad T(n) \text{ is } O(\log n)$$

$$T(n) = 2 \times T(n/2) + 1 \quad T(n) \text{ is } O(n)$$

$$T(n) = 2 \times T(n/2) + n \quad T(n) \text{ is } O(n \log n)$$

$$T(n) = 2 \times T(n-1) + 1 \quad T(n) \text{ is } O(2^n)$$

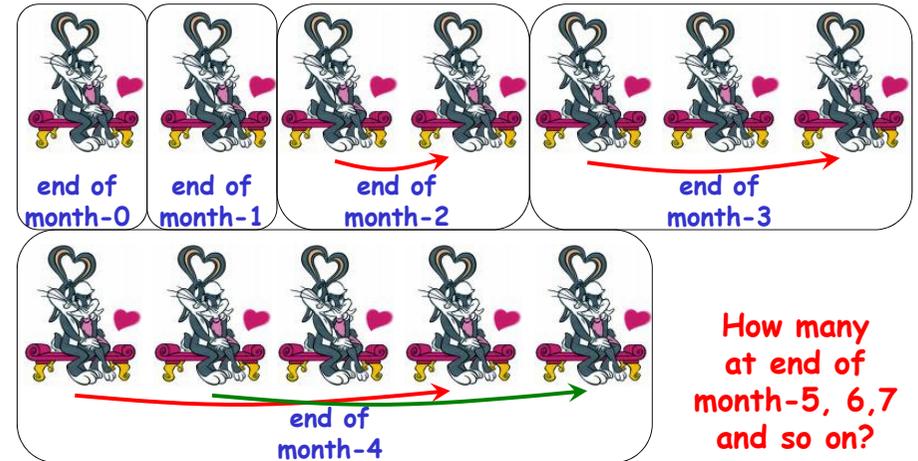

56

(Divide & Conquer)

# Fibonacci number ...

## Fibonacci's Rabbits

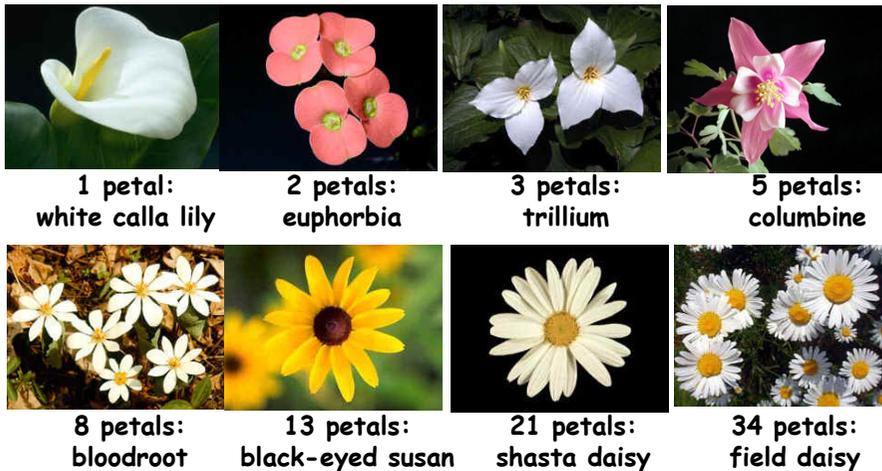

A pair of rabbits, one month old, is too young to reproduce.  
Suppose that in their second month, and every month thereafter, they produce a new pair.

58
