## Safety Problem: Incidents

# Safety Definition: Illustration

#### Safety Definition: Deep Neural Networks

- $\mathbb{R}^n$  be a vector space of inputs (points)
- *f* : ℝ<sup>n</sup> → *C*, where *C* is a (finite) set of class labels, models the human perception capability,
- ► a neural network classifier is a function  $\hat{f}(x)$  which approximates f(x)

#### Safety Definition: Deep Neural Networks

A (feed-forward) neural network N is a tuple  $(L, T, \Phi)$ , where

- ▶  $L = \{L_k \mid k \in \{0, ..., n\}\}$ : a set of layers.
- $T \subseteq L \times L$ : a set of sequential connections between layers,
- ▶  $\Phi = \{\phi_k \mid k \in \{1, ..., n\}\}$ : a set of *activation functions*  $\phi_k : D_{L_{k-1}} \rightarrow D_{L_k}$ , one for each non-input layer.

Safety Definition: Traffic Sign Example

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

#### Definition

The maximum safe radius problem is to compute the minimum distance from the original input  $\alpha$  to an adversarial example, i.e.,

$$MSR(\alpha) = \min_{\alpha' \in D} \{ ||\alpha - \alpha'||_k \mid \alpha' \text{ is an adversarial example} \}$$
(1)

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

#### Challenges

Challenge 1: continuous space, i.e., there are an infinite number of points to be tested in the high-dimensional space

Challenge 2: The spaces are high dimensional

Challenge 3: the functions f and  $\hat{f}$  are highly non-linear, i.e., safety risks may exist in the pockets of the spaces

Challenge 4: not only heuristic search but also verification

#### Approach 1: Single Layer – Discretisation

Define manipulations  $\delta_k : D_{L_k} \to D_{L_k}$  over the activations in the vector space of layer k.

Figure: Example of a set  $\{\delta_1, \delta_2, \delta_3, \delta_4\}$  of valid manipulations in a 2-dimensional space

# Exploring a Finite Number of Points

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ○ □ ○ ○ ○ ○

# Finite Approximation

#### Definition

Let  $\tau \in (0, 1]$  be a manipulation magnitude. The *finite maximum* safe radius problem FMSR $(\tau, \alpha)$  is defined over the manipulation magnitude  $\tau$  (details to be given later).

#### Lemma For any $\tau \in (0, 1]$ , we have that $MSR(\alpha) \leq FMSR(\tau, \alpha)$ .

#### Approach 2: Single Layer – Exhaustive Search

Figure: exhaustive search (verification) vs. heuristic search

Background and Challenges

Safety Definition and Layer-by-Layer Refinement

#### Game-based Approach for a Single Layer Verification

・ロト・日本・モート モー うへぐ

**Experimental Results** 

### Preliminaries: Lipschitz network

#### Definition

Network N is a Lipschitz network with respect to distance function  $L_k$  if there exists a constant  $\hbar_c > 0$  for every class  $c \in C$  such that, for all  $\alpha, \alpha' \in D$ , we have

$$|N(\alpha', c) - N(\alpha, c)| \le \hbar_c \cdot ||\alpha' - \alpha||_k.$$
(2)

Most known types of layers, including fully-connected, convolutional, ReLU, maxpooling, sigmoid, softmax, etc., are Lipschitz continuous [4].

### Preliminaries: Feature-Based Partitioning

Partition the input dimensions with respect to a set of features. Here, features in the simplest case can be a uniform partition, i.e., do not necessarily follow a particular method.

Useful for the reduction to two-player game, in which player One chooses a feature and player Two chooses how to manipulate the selected feature.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

#### Preliminaries: Input Manipulation

Let  $\tau > 0$  be a positive real number representing the manipulation magnitude, then we can define *input manipulation* operations  $\delta_{\tau,X,i} : D \to D$  for  $X \subseteq P_0$ , a subset of input dimensions, and  $i : P_0 \to \mathbb{N}$ , an instruction function by:

$$\delta_{\tau,X,i}(\alpha)(j) = \begin{cases} \alpha(j) + i(j) * \tau, & \text{if } j \in X \\ \alpha(j), & \text{otherwise} \end{cases}$$

for all  $j \in P_0$ .

## Approximation Based on Finite Optimisation

#### Definition

Let  $\tau \in (0,1]$  be a manipulation magnitude. The *finite maximum* safe radius problem FMSR( $\tau, \alpha$ ) based on input manipulation is as follows:

 $\min_{\Lambda' \subseteq \Lambda(\alpha)} \min_{X \subseteq \bigcup_{\lambda \in \Lambda'}} \min_{P_{\lambda}} \min_{i \in \mathcal{I}} \{ ||\alpha - \delta_{\tau, X, i}(\alpha)||_{k} | \delta_{\tau, X, i}(\alpha) \text{ is an adv. example} \}$ (3)

#### Lemma

For any  $\tau \in (0,1]$ , we have that  $MSR(\alpha) \leq FMSR(\tau, \alpha)$ .

We need to determine the condition for  $\tau$  to satisfy so that  $FMSR(\tau, \alpha) = MSR(\alpha)$ .

### Grid Space

#### Definition

An image  $\alpha' \in \eta(\alpha, L_k, d)$  is a  $\tau$ -grid input if for all dimensions  $p \in P_0$  we have  $|\alpha'(p) - \alpha(p)| = n * \tau$  for some  $n \ge 0$ . Let  $G(\alpha, k, d)$  be the set of  $\tau$ -grid inputs in  $\eta(\alpha, L_k, d)$ .

# misclassification aggregator

#### Definition

An input  $\alpha_1 \in \eta(\alpha, L_k, d)$  is a misclassification aggregator with respect to a number  $\beta > 0$  if, for any  $\alpha_2 \in \eta(\alpha_1, L_k, \beta)$ , we have that  $N(\alpha_2) \neq N(\alpha)$  implies  $N(\alpha_1) \neq N(\alpha)$ .

#### Lemma

If all  $\tau$ -grid inputs are misclassification aggregators with respect to  $\frac{1}{2}d(k,\tau)$ , then  $MSR(k,d,\alpha,c) \geq FMSR(\tau,k,d,\alpha,c) - \frac{1}{2}d(k,\tau)$ .

## Conditions for Achieving Misclassification Aggregator

Given a class label c, we let

$$g(\alpha',c) = \min_{c' \in C, c' \neq c} \{N(\alpha',c) - N(\alpha',c')\}$$
(4)

be a function maintaining for an input  $\alpha'$  the minimum confidence margin between the class c and another class  $c' \neq N(\alpha')$ .

#### Lemma

Let N be a Lipschitz network with a Lipschitz constant  $\hbar_c$  for every class  $c \in C$ . If

$$d(k,\tau) \le \frac{2g(\alpha',N(\alpha'))}{\max_{c \in C, c \neq N(\alpha')}(\hbar_{N(\alpha')} + \hbar_c)}$$
(5)

for all  $\tau$ -grid input  $\alpha' \in G(\alpha, k, d)$ , then all  $\tau$ -grid inputs are misclassification aggregators with respect to  $\frac{1}{2}d(k, \tau)$ .

#### Theorem

Let N be a Lipschitz network with a Lipschitz constant  $\hbar_c$  for every class  $c \in C$ . If

$$d(k,\tau) \leq \frac{2g(\alpha',N(\alpha'))}{\max_{c' \in C, c' \neq N(\alpha')}(\hbar_{N(\alpha')} + \hbar_{c'})}$$

for all  $\tau$ -grid inputs  $\alpha' \in G(\alpha, k, d)$ , then we can use FMSR $(\tau, k, d, \alpha, c)$  to estimate MSR $(k, d, \alpha, c)$  with an error bound  $\frac{1}{2}d(k, \tau)$ .
